Abstract

A new species, *Centaurea lovricii*, is described and illustrated from the island of Vis (Dalmatia, Croatia). It occurs on northwest-facing calcareous cliffs near the sea, where it grows with several other rare endemic species. *Centaurea lovricii* is morphologically similar to *C. glaberrima* and *C. divergens* of *C. sect. Centaurea*, from which it differs in having more succulent leaves with larger and less incised leaflets, bigger capitula, larger phyllaries with more developed appendages and denser and undulate fimbriae, larger florets, bigger achenes, and longer pappus. Its morphological features, distribution, ecology, conservation status and taxonomic affinities are examined. In addition, a new iconography and lectotypification for *C. glaberrima* and *C. divergens* is provided.

Keywords

Adriatic region, Balkan flora, *Centaurea*, Croatia, morphology, new species, taxonomy

Introduction

The genus *Centaurea* L. is one of the largest genera in the family Asteraceae. In its current circumscription as a natural group, it includes about 250 species (Susanna and Garcia-Jacas 2007, 2009). It is mainly distributed in the Euro-Mediterranean and

south-western Asian territories (Susanna et al. 1995, 2006; Susanna and Garcia-Jacas 2007, 2009; Font et al. 2009; López et al. 2011; Hilpold et al. 2014a, b). As emphasised by Hilpold et al. (2014b), three subgenera can be recognised, namely *C.* subgen. *Centaurea*, *C.* subgen. *Lopholoma* (Cass.) Dobrocz., and *C.* subgen. *Cyanus* (Mill.) Cass. ex Hayek, each represented by numerous sections and subsections.

According to the literature (Hilpold 2012; Boršić 2013; Hilpold et al. 2014a, b), within sect. *Centaurea* of subgen. *Centaurea* three subsections are recognised, i.e. subsect. *Centaurea*, subsect. *Phalolepis* (Cass.) Garcia-Jacas, Hilpold, Susanna & Vilatersana, and subsect. *Willkommia* (Blanca) Garcia-Jacas, Hilpold, Susanna & Vilatersana. In particular, subsect. *Centaurea* [formerly sect. *Acrolophus* (Cass.) DC.] is characterised by having triangular phyllary appendages that are regularly ciliate at the margin and often provided with a mucro at the apex. This subsection is widespread in the Mediterranean area (Hilpold 2012). Several of its species are distributed in Croatia, Montenegro, Serbia, Bosnia and Herzegovina, while some of them are exclusively known from Croatia and its islands (Lovrić 1976, 1990, 1995; Nikolić et al. 2015; Nikolić 2020, 2022). Within this subsection several endemic species are known from the western Balkan peninsula: *C. biokovensis* Teyber s.l., *C. crithmifolia* Vis., *C. cuspidata* Vis. s.l., *C. dalmatica* A.Kern., *C. derventana* Vis. & Pančić, *C. divergens* Vis., *C. fridericii* Vis., *C. glaberrima* Tausch, *C. gloriae* Radić, *C. incompta* Vis., *C. kartschiana* Scop., *C. radichii* Plazibat, *C. spinosociliata* Seenus s.l. and *C. visianiana* Plazibat.

During field investigations focused on the flora of the Dalmatian islands (Croatia) a peculiar chasmophilous population of *Centaurea* growing on the cliffs of the island of Vis was found. Previously, it was examined by Lovrić (1982, 1983, 1990, 1995) and named *C. issaea* or *C. glaberrima* var. *issaea*. However, these names must be considered *nomina nuda*, because a description was not provided for them and no type material was indicated. According to Art. 38.1 and 40 of the ICN (Turland et al. 2018), the names were therefore not validly published. Later, these names were used by several authors (Van der Maarel and Van der Maarel-Versluys 1996; Bogdanović and Ruščić 2011; Boršić 2013; Terzi et al. 2019; Nikolić 2020, 2022), all confirming the occurrence of this taxon on the island of Vis. According to the results of molecular genetic investigations (nuclear and plastid DNA sequences, as well as Amplified Fragment Length Polymorphism data - AFLP) carried out by Boršić (2013) on the amphi-Adriatic species of *Centaurea*, the population from Vis island is closely related to *C. glaberrima*, a species occurring in southern Croatia, Montenegro, Albania, Bosnia and Herzegovina. To examine the affinities of these two taxa, morphological studies of populations from the island of Vis and the type locality of *C. glaberrima* in Dalmatia were carried out, as well as of its type specimen kept in PRC. These analyses show that the population from the island of Vis is highly distinct from *C. glaberrima*, as well as from the allied *C. divergens* and the other species belonging to subsect. *Centaurea*. Therefore, based on morphological and ecological differences with other species in this subsection, the plants in question are treated here as a new species for science and named *C. lovricii*.

Materials and methods

For this morphological study, we examined 90 herbarium specimens and scanned images of specimens from several, also virtual, herbaria (BEO, BEOU, BP, BUNS, CAT, CNHM, K, MW, P, PAD, PI, PRC, SARA, U, W, WU, ZA, ZAGR and ZAHO). The herbarium acronyms follow Thiers (2022). In addition, we collected 20 plants of *C. lovricii* from the island of Vis (one population), and 50 plants of *C. glaberrima* (seven populations) and 40 plants of *C. divergens* (seven populations) from several other localities in Croatia, including *loci classici*. The investigations were carried out on material preserved in alcohol and glycerine solution, as well as on herbarium exsiccatae deposited at CAT and ZAGR. Information about distribution, habitat, ecology and phenology were obtained from field data and herbarium specimens.

Taxonomic treatment

1. *Centaurea lovricii* Bogdanović, Boršić, Ljubičić, Brullo & Giusso, sp. nov.

urn:lsid:ipni.org:names:77309067-1

Figs 1–3B, C, D

Centaurea glaberrima var. *issaea* Lovrić, Taxon 31(4): 763, 1982 (nom. nud.).

Centaurea issaea Lovrić, Pos. izd. Muz. grada Šibenika 10: 191, 1983 (nom. nud.).

Type. CROATIA. Island of Vis, Blišćevac bay, calcareous rocky slopes, 16 May 2021, 43°4'23.30"N, 16°5'51.59"E, S. Bogdanović & M. Temunović s.n. (holotype: ZAGR-68512; isotypes: CAT, CNHM, ZA, ZAGR).

Description. Perennial herb, with several stems, sterile leaf-rosettes and woody rootstock. Stems erect, glabrous, striate, shiny green, 25–50 cm long, not winged, laxly branched. Basal leaves fleshy, shiny green, glabrous, 1–2 pinnatisect, 7–20 cm × 5–40 mm; leaflets 5–15 per side, lanceolate, linear-lanceolate to linear, or oblong lanceolate, 5–30 × 0.8–5(–10) mm, often the terminal ones lanceolate and up to 10 mm wide; young leaves oblong lanceolate with entire margin or with few lateral teeth; petioles 5–55 mm long. Median and upper caudine leaves similar to basal ones, sessile or subsessile, 1(–2) pinnatisect, 1.5–12 × 0.5–3 cm; leaflets 1–12 per side, linear-lanceolate to linear, margins entire. Synflorescence laxly paniculate, with 7–30 solitary capitula. Peduncles 1–20 cm long, apex clavate, bracts 1–8, entire. Involucro ovoid, 13–15 × 8–12 mm. Phyllaries straw-coloured, glabrous, coriaceous, dorsally with 3–7 nerves; the outer ones ovate, 6.5–8 × 2.5–3.5 mm; the median ones ovate-oblong, 10–15 × 3.5–4.5 mm; the innermost linear, 12.5–15 × 2–2.8 mm; phyllary appendages well-developed, triangular to orbicular, dark brown, appressed, densely fimbriate with 7–10 pairs of undulate fimbriae, 0.3–1.7 mm long, ending with a terminal acute tooth. Florets pink-purplish. Outermost florets sterile; corolla tube glabrous, 7.5–9 mm long; corolla lobes linear, irregular, 7.5–11.5 mm long. Disc

Figure 1. Habit of *Centaurea lovricii* sp. nov. Drawn by Salvatore Brullo.

florets fertile; corolla tube 10–11.5 mm long; corolla lobes linear, equal, 5 mm long. Stamens 12.5–13.5 mm long; filaments 4.5–5 mm long; anthers 8–8.5 mm long, dark violet. Style 16–16.5 mm long, ciliate at apex; stigmas 1.5 mm long. Achenes oblong,

2.6–3 × 1.4–1.5 mm, glabrous, dark brown up to the apex, with several irregular straw-coloured longitudinal ridges. Pappus obscurely biseriate, whitish, with bristles 0.6–2.3 mm long.

Etymology. This species is dedicated to the Croatian botanist Andrija-Željko Lovrić (1943–2018), who was the first to collect it and consider it as a new species.

Phenology. *Centaurea lovricii* flowers from May to late June, and fruits from late June to July.

Distribution and ecology. This new species grows along the northern coast between Dragodid Bay and Oključina Bay of the island of Vis in Dalmatia, Croatia (Fig. 4). It grows on sea facing cliffs constituted of Triassic dolomites (Ložić et al. 2012) at 10–100 m a.s.l., in rocky crevices together with many other rare or endemic species (Fig. 3A). The most frequent chasmophytes occurring in this habitat are *Aurinia leucadea* subsp. *scopulorum* (Ginzb.) Plazibat, *Campanula teutana* Bogdanović & Brullo, *Centaurea ragusina* L., *Helichrysum italicum* subsp. *pseudolitoreum* (Fiori) Bacch., Brullo & Mossa, *Brassica incana* Ten., *Limonium issaeum* Bogdanović & Brullo, *Pimpinella tragium* subsp. *lithophila* (Schischk.) Tutin and *Sesleria interrupta* Vis. (Bacchetta et al. 2003; Bogdanović and Ruščić 2011; Bogdanović et al. 2014; Bogdanović and Brullo 2015; Terzi et al. 2019).

Conservation status. The single population of *C. lovricii* is composed of fewer than 1000 scattered mature individuals, so it can be considered Vulnerable (VU D1) according to the IUCN Red List Categories and Criteria (IUCN 2022). It is currently distributed in a very narrow coastal belt of ca. 0.5 km², so it has a restricted area of occupancy and only one location, but as its growing site is very steep and quite inaccessible, which makes the population unthreatened by any human disturbance, it does not qualify for subcriterion D2.

Chromosome number. According to Lovrić (1982, 1983) and Van Loon (1987) the ploidy level of *C. lovricii*, previously attributed to “*C. glaberrima* var. *issaed*”, is tetraploid with $2n = 4x = 36$ chromosomes, similarly to that of the allied species *C. glaberrima* and *C. divergens* (Siljak-Yakovlev et al. 2005). According to Boršić (2013) the estimated ploidy level for “*C. issaed*” is also tetraploid.

Discussion. Within *Centaurea* subsect. *Centaurea*, *C. lovricii* is most similar to *C. glaberrima*, particularly in the morphology of its capitula and phyllaries. *Centaurea glaberrima* is a species occurring in several localities in the north-western Balkans (Nikolić et al. 2015). However, these two species show some significant differences in habit and the morphology of their leaves, capitula and achenes (Table 1). In particular, *C. glaberrima* (Figs 5, 6) has a more robust and rigid habit, stems with up to 80 capitula, rigid basal leaves with leaflets linear-filiform (0.5–2 mm wide), involucre 6–10 mm long, with phyllaries up to 8 mm long, appendages straw-coloured, often tinged with pale-brown, with sparse fimbriae, outermost sterile florets with corolla tube 6–6.5 mm long and pappus bristles 0.2–0.8 mm long. In addition, the two species have different ecological requirements. *Centaurea glaberrima* usually behaves as a ruderal plant growing along roadsides, in dry rocky grasslands and occasionally also in rupestrian stands, whereas *C. lovricii* is a true chasmophyte in coastal stands. A population genetic study of some endemic Adriatic species of *Centaurea* using AFLPs was

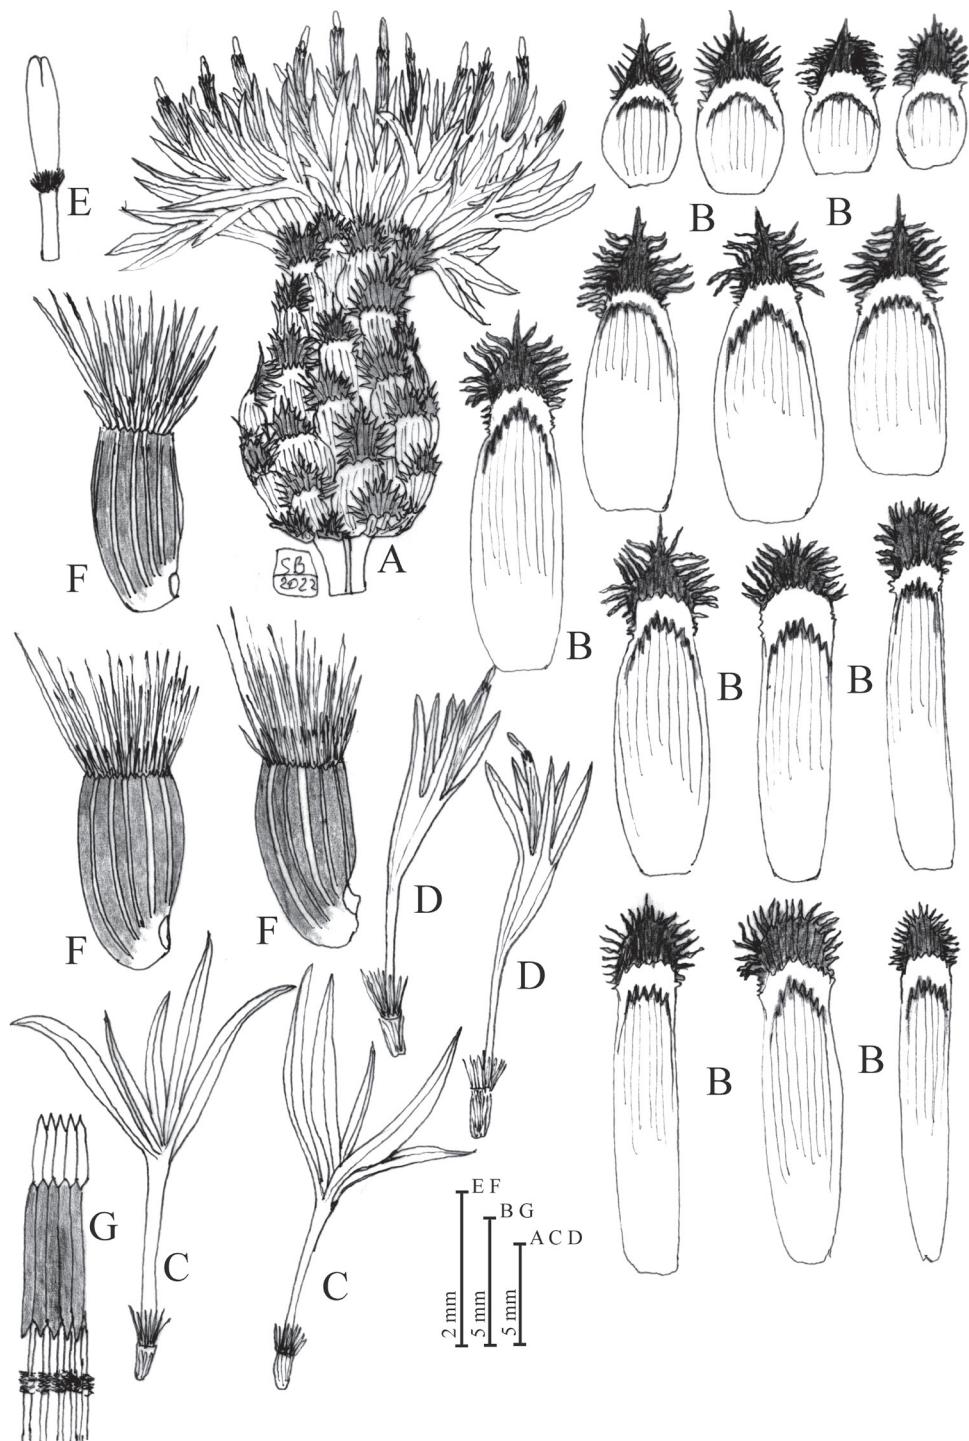

Figure 2. *Centaurea lovricii* sp. nov. **A** capitulum **B** phyllaries **C** outermost sterile florets **D** disc florets **E** stigma **F** achenes **G** stamens upper part. Drawn by Salvatore Brullo.

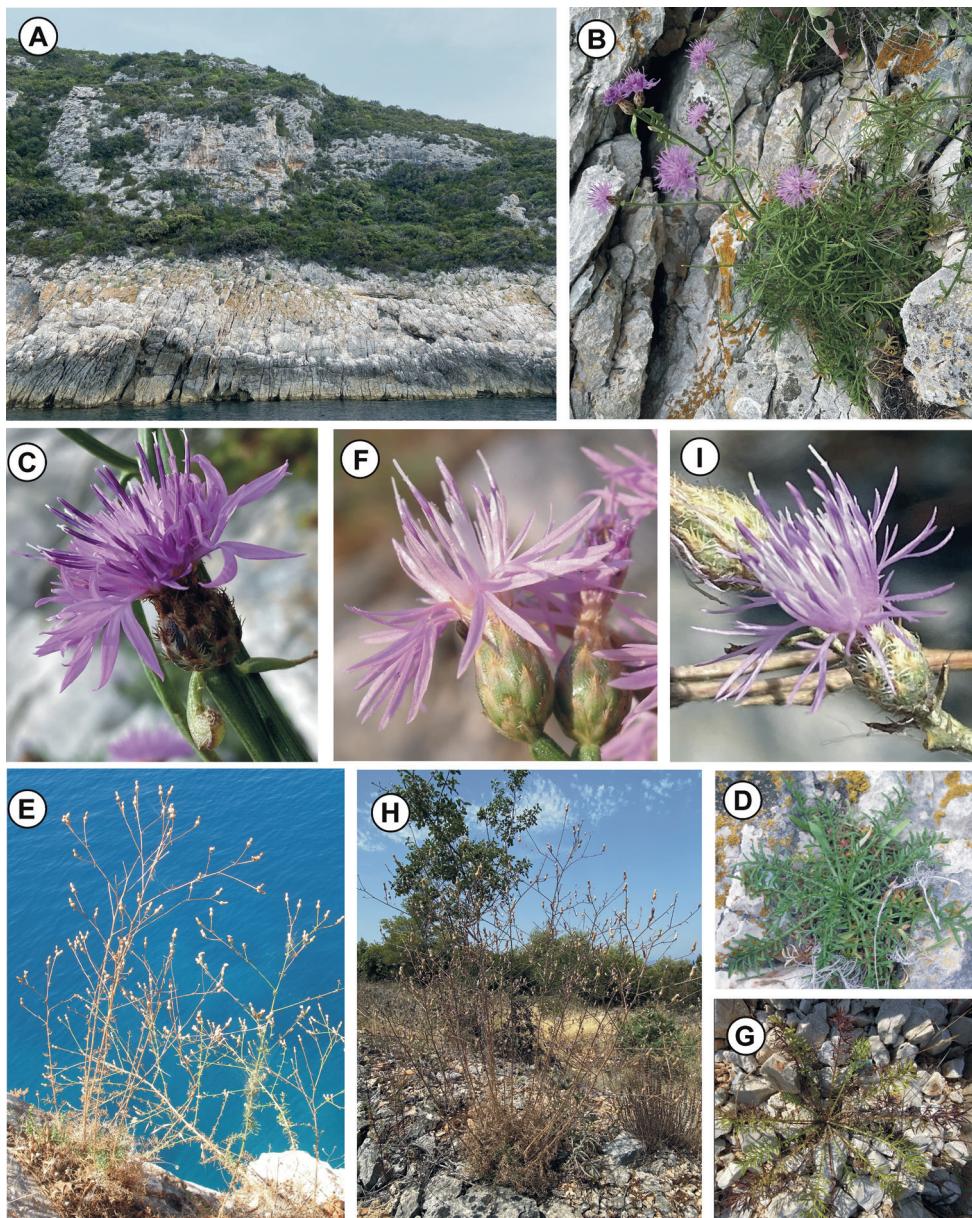

Figure 3. *Centaurea lovricii* sp. nov. **A** habitat **B** plant growing in natural habitat **C** capitulum **D** basal leaves; *C. glaberrima* **E** plant growing in natural habitat **F** capitula **G** basal leaves; *C. divergens* **H** plant growing in natural habitat **I** capitulum. carried out by Boršić (2013), who showed the distinctness of the population from the island of Vis (sub *C. issaea*) from *C. glaberrima*, but also concluded that this population shows evidence of introgression with *C. glaberrima* and *C. spinosociliata*. A phylogeny

based on nrDNA internal transcribed spacer sequences revealed that *C. lovricii* still has an unclear phylogenetic position among the species of *C. sect. Centaurea* included in this study (Boršić 2013).

Another morphologically similar species is *C. divergens* (Fig. 6), which is often treated as a subspecies or variety of *C. glaberrima* (Malý 1928; Hayek 1931; Lovrić 1967–1968; Dostál 1976; Gavrilović and Janačković 2022), but its treatment as a distinct species, as proposed by Visiani (1847) and Hayek (1901), seems to be more appropriate (see Table 1). It differs from *C. lovricii* in having a hispid stem, rigid and dull green basal leaves with linear-filiform leaflets (0.5–2 mm wide), a 6–10 mm long involucre, phyllaries that are up to 8 mm long, with up to 2 mm long fimbriae, outermost sterile florets with a 5.5–6 mm long corolla tube, and up to 1.1 mm long pappus bristles. They are also ecologically well differentiated, because *C. divergens* is usually a typical ruderal species, while *C. lovricii* is a chasmophyte.

A nomenclatural overview and lectotype designation for *C. glaberrima* and *C. divergens*, species closely related to *C. lovricii*, are here provided:

Table 1. Main diagnostic features of *Centaurea lovricii*, *C. glaberrima* and *C. divergens*.

	<i>C. lovricii</i>	<i>C. glaberrima</i>	<i>C. divergens</i>
Stem	glabrous, shiny, 25–50 cm long,	glabrous, dull, 25–80 cm long,	hispid, dull, 25–100 cm long,
Basal leaves	fleshy, robust, glabrous, 1–2 pinnatisect, 7–20 cm long, with leaflets lanceolate to linear, 5–30 × 0.8–5 mm, the terminal one up to 10 mm wide	thin, rigid, glabrous, 1–3 pinnatisect, 8–15 cm long, with leaflets linear-filiform, 2–15 × 0.5–0.8(–2) mm	thin, rigid, hispid, 1–3 pinnatisect, 8–20 cm long, with leaflets linear-filiform, 2–15 × 0.5–0.8(–2) mm
Cauline leaves	1.5–12 cm long, 1–12 leaflets per side, linear lanceolate to linear	0.5–5 cm long, 1–15 leaflets per side, linear-filiform	0.5–7 cm long, 1–10 leaflets per side, linear-filiform
Synflorescence	laxly branched, with 7–30 capitula	laxly paniculate, very branched, with (15)50–80 capitula	densely paniculate, very branched, with 15–80 capitula
Capitula	solitary, involucre 13–15 × 8–12 mm, with peduncle 1–20 cm long	solitary to grouped, involucre 6–8.5(–10) × 4.5–5.5 mm, with peduncle 0.3–6 cm long	solitary to grouped, involucre 6–10 × 4–6.5 mm, with peduncle 0.2–7 cm long
Phyllaries	6.5–15 × 2–4.5 mm, with appendages triangular to orbicular, dark-brown, densely fimbriate with 7–10 pairs of undulate fimbriae 0.3–1.7 mm long	2.5–8 × 1.2–2.6 mm, with appendages triangular to orbicular, straw-coloured often tinged with pale-brown, 4–8 pairs of lax and more or less straight fimbriae, which are 0.3–1(–1.5) mm long	3–8 × 1.4–2.2 mm, with appendages triangular, straw-coloured, tinged with pale-brown, 3–6 pairs of lax and more or less straight fimbriae, which are 0.2–2 mm long
Corolla of outermost sterile florets	tube 7.5–9 mm long, lobes 7.5–11.5 mm long	tube 6–6.5 mm long, lobes 2–4.1 mm long	tube 5.5–6 mm long, lobes 3–6 mm long
Corolla of disc florets	tube 10–11.5 mm long, lobes 5 mm long	tube 5–6 mm long, lobes 2–2.5 mm long	tube 6.5–7.5 mm long, lobes 3–3.3 mm long
Stamens	12.5–13.5 mm long, with filament 4.5–5 mm long and anthers 8–8.5 mm long	7.5–9.8 mm long, with filaments 5.3–5.8 mm long and anthers 2.2–4 mm long	10–10.5 mm long, with filaments 5–5.5 mm long and anthers 5 mm long
Style	16–16.5 mm long	7.5–8.3 mm long	10 mm long
Stigma	1.5 mm long	1.25 mm long	1.2 mm long
Achenes	2.6–3 × 1.4–1.5 mm, glabrous, dark-brown up to the apex	2.5–2.7 × 1–1.2 mm, glabrous, dark-brown with straw-coloured strip above	2.3–2.5 × 0.9–1.1 mm, sparsely hairy, dark-brown with straw-coloured strip above
Pappus	obscurely 2-seriate, with bristles 0.6–2.3 mm long	2-seriate, with bristles 0.2–0.8 mm long	2-seriate, with bristles 0.2–1.1 mm long

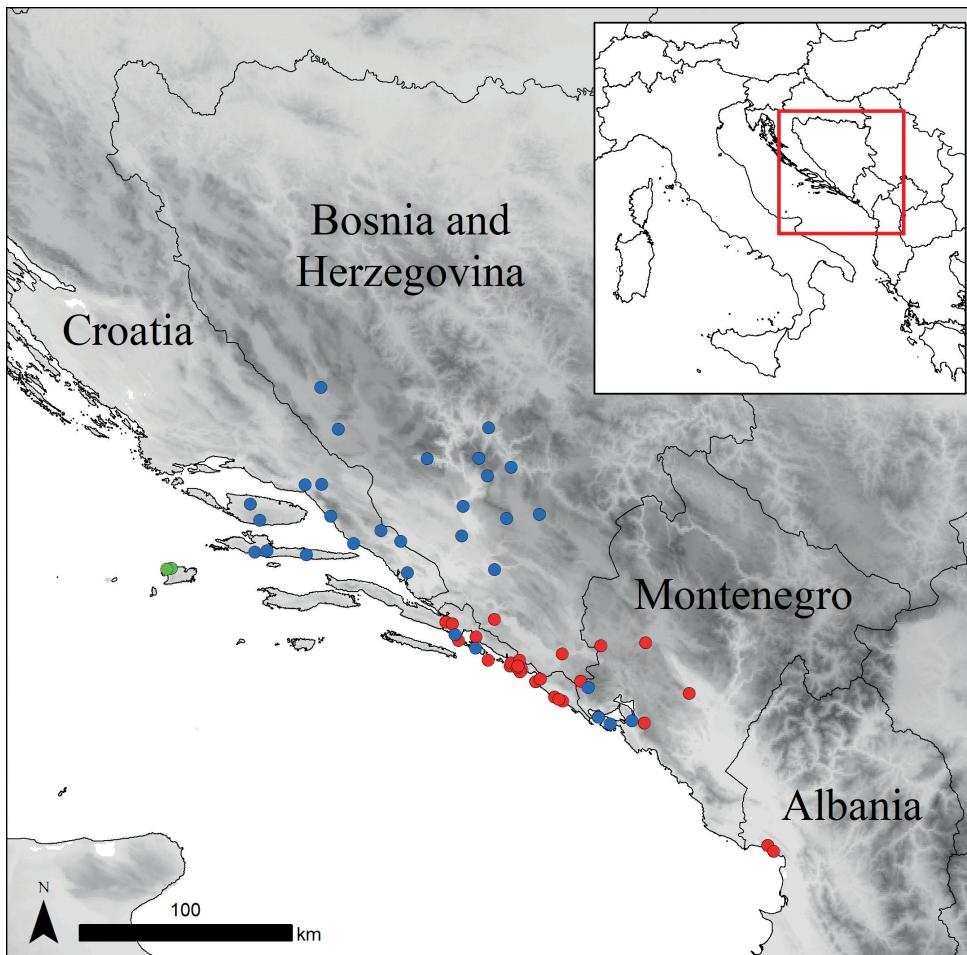

Figure 4. Distribution of *Centaurea lovricii* sp. nov. (green dots), *C. glaberrima* (red dots) and *C. divergens* (blue dots).

2. *Centaurea glaberrima* Tausch, Syll. Pl. Nov. 2: 249, 1828.

Figs 5, 6

Centaurea punctata Vis., Flora 12: 23, 1829. Type: Croatia. In agris sterilibus Dalm. [Dalmatia] montanae (prope Duare), *Visiani s.n.* (lectotype, designated here: PAD – HD02644).

Type. CROATIA. e Dalmat. [Dalmatia], s.d., *Sieber s.n.* (lectotype, central specimen designated here: PRC).

Nomenclatural note. Tausch (1828) described *C. glaberrima* from Dalmatia without indicating any precise locality. The herbarium sheet, with three specimens, that we found in PRC has an original herbarium label with Tausch's handwriting: “*Centaurea* – ?”

Figure 5. Habit of *Centaurea glaberrima*. Drawn by Salvatore Brullo.

e Dalmat. Sber. capit: parvus ovoideus divaricatum". Tausch usually shortened geographical names: "e Dalmat." refers to specimens collected in eastern Dalmatia, while "Sber." refers to the collector (i.e. Sieber). In addition, he provided a short morphological description. Later, to the same herbarium label, the identification [= *C. punctata* Vis.] was added. This was probably done by V. Kosteletzky (pers. observ. by curator P. Mraz). The fourth specimen on the sheet belongs to *C. spinosociliata* and it is correctly identified on a separate herbarium label by A. Hayek. Here we select the central specimen, which fits Tausch's description, as lectotype for the name *C. glaberrima*. One year later, Visiani (1829) described *C. punctata* from Duare [Zadvarje] in Dalmatia. We consulted the type specimen in PAD (PAD – HD02644), which fits Visiani's description given in the protologue. In fact, the morphology of the specimen perfectly corresponds to Tausch's description of *C. glaberrima*. Therefore, we here designate this specimen as a lectotype and include the name *C. punctata* as a synonym of *C. glaberrima*.

Iconography. Figs 5, 6; Tav. 11, Visiani, Fl. Dalmat. 2: 39, 1847, sub *C. punctata*; Tav. 47 (II, III, 4–14), Reichenbach, Icon. Fl. Germ. Helv. 15: 30, 1852, sub *C. punctata*; Tav. 155 (II, 10–11), Reichenbach, Icon. Fl. Germ. Helv. 15: 31, 1853, sub *C. punctata*.

Distribution. According to Greuter (2006), Barina et al. (2015) and Nikolić et al. (2015), *C. glaberrima* is distributed in Albania, Bosnia and Herzegovina, Croatia and Montenegro (Fig. 4).

3. *Centaurea divergens* Vis., Fl. Dalmat. 2: 37, 1847.

Fig. 6

Acosta divergens (Vis.) Soják, Čas. Nár. Muz. Odd. Přír. Prague 140: 134, 1972. Type.

Based on *Centaurea divergens* Vis.

Centaurea glaberrima subsp. *divergens* (Vis.) Hayek, Repert. Spec. Nov. Regni Veg. Beih. 30(2): 260, 1931. Type. Based on *Centaurea divergens* Vis.

Centaurea glaberrima var. *divergens* (Vis.) Malý, Glasn. Zemaljsk. Muz. Bosne Hercegovine Sarajevu. Prir. Nauke 40(1): 122, 1928 Type. Based on *Centaurea divergens* Vis.

Centaurea petteri Rchb.f., Icon. Fl. Germ. Helv. 15: 36, 1852. Type. Croatia. Auf dem Monte Mossor Dalm., June, Reichenbach fil. s.n. (W1889-0292916).

Type. CROATIA. In apricis montium Lesina, s.d., Stalio 448 (lectotype, designated here: PAD – HD02637).

Nomenclatural note. *Centaurea divergens* was described from the island of Hvar in central Dalmatia by Visiani (1847). In the protologue, Visiani clearly indicated "in saxosis collium, et montium circa Lessina, unde misit prof. Stalio" and we found original type material in the PAD herbarium that corresponds to description given in the protologue. Here we select a specimen that fits Visiani's description as lectotype for the name *C. divergens*.

Iconography. Fig. 6; Tav. 12(b)(41), Visiani, Fl. Dalmat. 2: 37, 1847; Tav. 51 (772) I, 1–7, Reichenbach, Icon. Fl. Germ. Helv. 15: 35, 1852; Tav. 52 (783) II, 9–16, Reichenbach, Icon. Fl. Germ. Helv. 15: 36, 1852, sub *Centaurea petteri*.

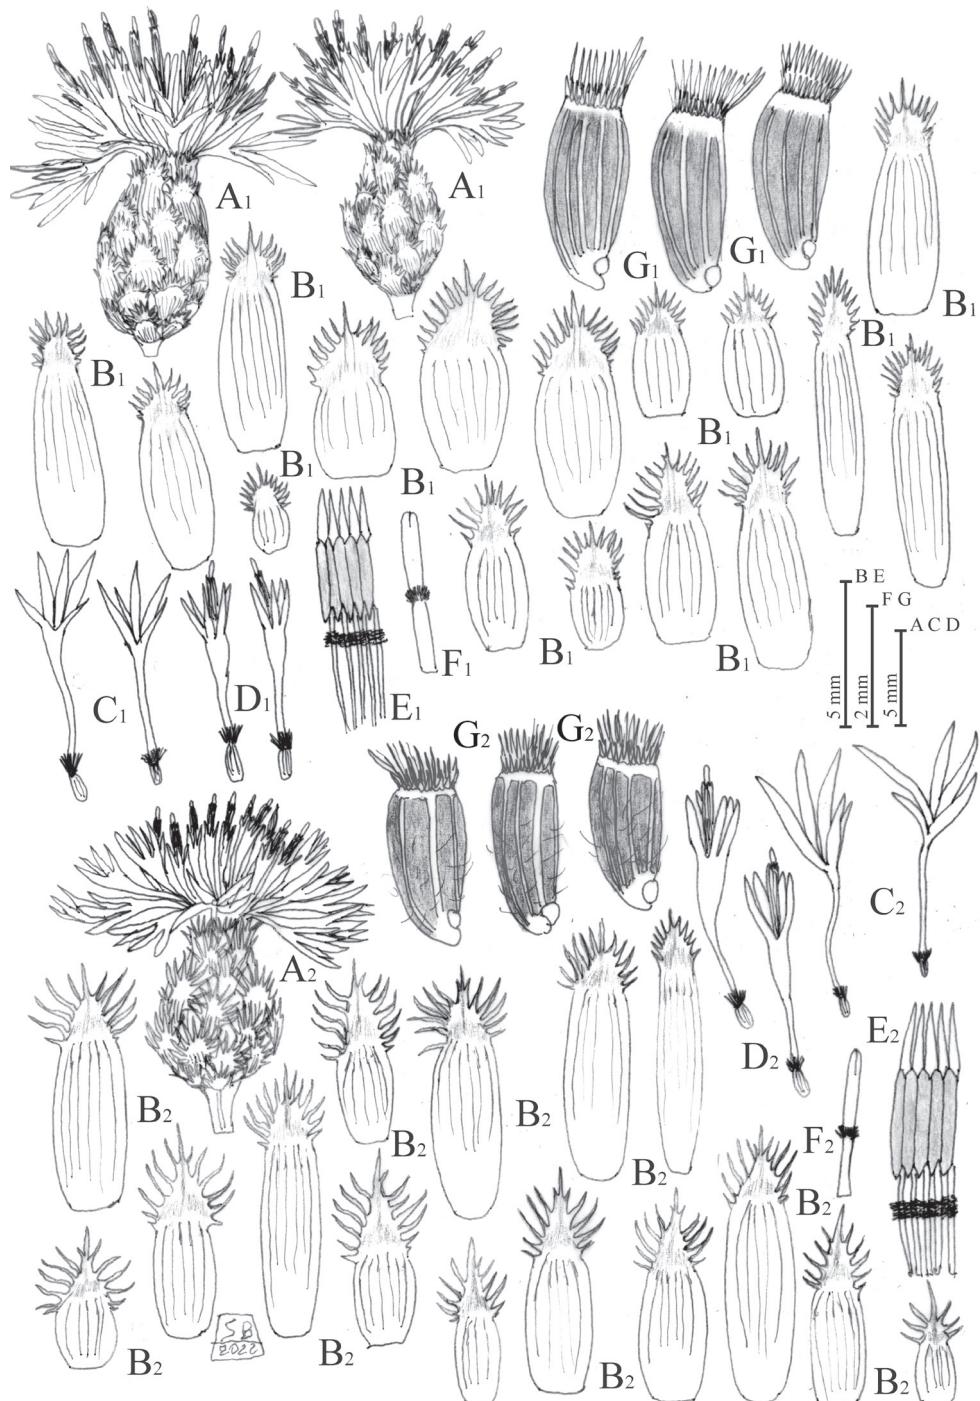

Figure 6. *Centaurea glaberrima* (1) and *C. divergens* (2) **A** capitula **B** phyllaries **C** outermost sterile florets **D** disc florets **E** stamens upper part **F** style.

Distribution. According to Greuter (2006), *C. divergens* is distributed in Bosnia and Herzegovina, Croatia, Montenegro (Fig. 4) and as an adventive plant in France.

Additional specimens examined. *Centaurea lovricii* (paratypes): CROATIA. Split-Dalmatia County, island of Vis, Kraljičina špilja, vertical rocks, 26 April 2010, S. Bogdanović & Z. Liber s.n. Key to *Centaurea lovricii* and allied species

- 1 Stem with 7–30 capitula; basal leaves fleshy, shiny, leaflets lanceolate to linear (0.8–10 mm wide); involucre 13–15 mm long, 8–12 mm wide; phyllaries up to 15 mm long, appendages dark-brown, fimbriae dense; outermost florets with lobes 7.5–11.5 mm long; pappus bristles up to 2.3 mm long *C. lovricii*
- Stems with up to 80 capitula; basal leaves rigid, dull, leaflets linear-filiform (0.5–2 mm wide); involucre 6–10 mm long, 4–6.5 mm wide; phyllaries up to 8 mm long, appendages straw-coloured tinged with pale brown, fimbriae sparse; outermost florets with lobes 2–6 mm long; pappus up to 1.1 mm long 2
- 2 Leaves glabrous; fimbriae on phyllaries up to 1(–1.5) mm long; disc floret tube 5–6 mm long and lobes 2–2.5 mm long; pappus bristles up to 0.8 mm long *C. glaberrima*
- Leaves hispid; fimbriae on phyllaries up to 2 mm long; disc floret tube 6.5–7.5 mm long and lobes 3–3.3 mm long; pappus bristles up to 1.1 mm long *C. divergens*

Acknowledgements

We thank the curators of BEO, BEOU, BP, BUNS, CAT, CNHM, K, MW, P, PAD, PI, PRC, SARA, U, W, WU, ZA, ZAGR and ZAHO for enabling the examination of their herbarium specimens. We especially would like to thank Patrik Mráz (PRC) and Rossella Marcucci (PAD) for searching type specimens in their collections. Prof. Sandro Bogdanović would like to thank the University of Zagreb, Programme of Academic Mobility for partial funding of this research and the Erasmus+ programme for facilitating the collaboration with Prof. Gianpietro Giusso del Galdo from the University of Catania, Department of Biological, Geological and Environmental Sciences.
