Abstract

Herminium (Orchidaceae, Orchidoideae) is a medium-sized genus widespread in the northern hemisphere, with a clear centre of diversity in the Himalayas. We present a comprehensive taxonomic revision of *Herminium* based on field observations and morphological studies, for which we examined about 2500 specimens. We recognize 49 species grouped into six formal sections, including one new species, *Herminium tibeticum*, from Tibet. We provide an identification key to the species, descriptions of the species, notes on ecology and distribution, and complete nomenclature for each species, including typifications. We here designate lectotypes for five species and reduce four taxa to synonymy.

Keywords

Herminium tibeticum, key, morphology, synonyms, taxonomy

Introduction

Herminium L. is a widely distributed genus, ranging from Europe through most of continental Asia to Japan, the Malay Archipelago and New Guinea (Fig. 1). However, most species are restricted to continental Asia, in particular to the Pan-Himalayan region, with only one, non-endemic species each in Europe (*H. monorchis*) and tropical Southeast Asia, including New Guinea (*H. lanceum*) (Hooker 1890; Tang and Wang 1937, 1940; Lang 1988; King and Pantling 1898; Press et al. 2000; Pridgeon et al.

Figure 1. Geographical distribution of *Herminium*.

2001; Pearce and Cribb 2002; Chen et al. 2009; Averyanov and Averyanova 2003; Averyanov 2010; Kurzweil 2010; Lee et al. 2013; Kurzweil and Lwin 2014).

In most of the earlier, floristic literature, such as Duthie (1906), Hooker (1890), King and Pantling (1898), and Tang and Wang (1937, 1940), *Herminium* was accepted in a broad sense. More recent authors, such as Seidenfaden (1977), Hara et al. (1978), Hunt (1970), Lang (1988), Pridgeon et al. (2001), Agrawala et al. (2010) and Ormerod (2013) took a more narrow view to the genus and recognized a number of small satellite genera, including *Androcorys* Schltr., *Bhutanthera* J. Renz, *Frigidorchis* Z.J. Liu & S.C. Chen, and *Porolabium* T. Tang & F.T. Wang. Raskoti et al. (2016) found that these satellite genera as well as certain misplaced members of *Peristylus* Blume and *Platanthera* Rich. were nested within *Herminium* s.l. This led these authors to propose a broader delimitation of the genus, which we also adopt in this revision.

As redefined, *Herminium* is a genus of 49 species of predominantly terrestrial orchids in the subtribe Orchidinae, characterized by having a (sub)globose tuber, a lip with a concave or spurred base, and pollinia with reduced caudicles. Unlike in the closely related genus *Peristylus*, the stigma-lobes are not adnate to the base of the lip. Most species have quite small, greenish, whitish or yellowish flowers arranged in racemes. Apart from regional treatments (e.g. Chen et al. 2009, Pearce and Cribb 2002, Pradhan 1976), no modern revision of the genus as a whole has been undertaken before. Here we present such a revision, which should make it easier to identify these inconspicuous orchids.

Materials and methods

Vegetative as well as reproductive characters of *Herminium* were examined in the natural habitats and in herbaria. Herbarium specimens collected during our fieldwork were deposited in the Chinese National Herbarium (PE) and the National Herbarium and Plant Laboratories in Nepal (KATH). Flowers were preserved in formalin-acetic-acid-alcohol (FAA) for further study. Such material was studied in the laboratory under a stereomicroscope. Photographs and measurements were taken using image software of Nikon Instruments Inc., NIS-Elements D 3.10.

Specimens deposited at CAL, CDBI, DD, E, HNWP, KATH, K, KUN, LINN, PE, SIN, TI, and TAIF herbaria were examined. Photographs of the specimens were also studied from several herbaria (such as NY, P, UPS, W) where direct access was not possible. Over 2500 specimens, including types of most species, from the distributional range of *Herminium* have been examined.

Vegetative characters, such as tuber, leaf shape, phyllotaxy, and peduncle scales, and reproductive characters such as sepals, petals, lip and column, were examined. Flowers of dried specimens were rehydrated in boiling water prior to dissection. Floral characters such as bracts, sepals, petals, lip, and column were observed and measured with the help of a stereomicroscope. Literature, including Hooker (1890), King and Pantling (1898), Tang and Wang (1937, 1940), Pradhan (1976), Lang (1988), Press et al. (2000), Pearce and Cribb (2000; 2001), Boufford (2003), Chen et al. (2009), Agrawala et al. (2010), Averyanov (2010), Raskoti (2012, 2013), Ormerod (2013), Kurzweil (2010), and Kurzweil and Lwin (2014), was consulted for general distribution data and to assess some morphological characters of species we have been unable to examine ourselves. Thirty-seven morphological characters were compared (see Raskoti et al. 2016), and a set of diagnostic characters was chosen for the preparation of a dichotomous key. Based on phylogenetic analyses (Raskoti et al. 2016) and comparison of morphological characters with its relatives, a new species (*Herminium tibeticum*) is described and illustrated (see taxonomic treatment).

Habitat information is based on field observations, literature and herbarium labels. The distribution map was produced using DIVA GIS 7.5 (www.diva-gis.org) based on labels of representative specimens as well as data in the literature (e.g., Pearce and Cribb 2002, and Chen et al. 2009). Phenology is based on field observations of authors, information of labels and data in the literature (e.g., Pearce and Cribb 2002, and Chen et al. 2009).

General morphology

Tuber: Unbranched, smooth, globose to oblong or ovoid. Slender roots are produced from the stem just above the tuber. The simple, rounded tuber in *Herminium* represents a major difference with the subterranean parts of Eurasian species of *Platanthera*, in which a tuber is either absent or is drawn out into a tapering, root-like tip (Fig. 4).

Figure 2. Habitat of *Herminium*. **A** *H. chloranthum* (Terrestrial) **B** *H. quinquelobum* (Epiphytic on tree trunk).

Figure 3. Elevational range of *Herminium*.

Figure 4. Subterranean parts of *Herminium* and *Platanthera*. **A** *Herminium* sp. **B** *Platanthera* sp.

Phyllotaxy: Leaf number and arrangement vary in *Herminium*. Leaves can be single or paired, or there can be more than two leaves; they can be basal or cauline, opposite, subopposite or spirally arranged. Except for *H. monophyllum* and *H. monorchis*, most of the subtropical and temperate species have several cauline leaves (e.g. *Herminium lanceum*, *Herminium longilobatum*, *Herminium clavigerum*) whereas subalpine and alpine species have only one or two basal leaves.

Leaves: Leaf shape in *Herminium* varies from linear, oblong, lanceolate, ovate, ovate-orbicular to spathulate; the basal part always forms an amplexicaul sheath; the leaf apex can be obtuse, acute or acuminate. Linear leaves are restricted to subtropical and temperate species (*H. lanceum*, *H. longilobatum*, *H. mackinnonii*, *H. quinquelobum*); however, some subtropical and temperate species have ovate to oblong leaves (*H. latilabre*, *H. clavigerum*). Leaves may be shortly petiolate (*H. humidicola*), but are usually sessile.

Stem: Erect, glabrous. The stem may be abbreviated as in *H. humidicola*, *H. handelii*, and *H. albomarginatum* or elongate as in *H. clavigerum*, *H. edgeworthii*, and *H. lanceum*. The stem is covered by tubular sheaths but these do not produce a pseudostem, except in *H. humidicola*.

Inflorescence: This is almost always an unbranched raceme but in *H. humidicola* it is subcorymbose. The peduncle is cylindrical and smooth, except for the winged peduncle in *H. hongdeyuanii*. Most species have an elongate, densely many-flowered rachis (e.g. *H. clavigerum*, *H. longilobatum*, *H. lanceum*), but some, such as *H. humidi-*

Figure 5. Flowers of representative species of *Herminium*. **A** *H. monorchis* **B** *H. latilabre* **C** *H. forceps* **D** *H. fallax* **E** *H. lanceum* **F** *H. edgeworthii* **G** *H. monophyllum* **H** *H. quinquelobum* **I** *H. pugioniforme*.

cola and *H. albomarginatum* have a short rachis with few, sometimes laxly arranged flowers. The peduncle may be shorter than the rachis or sometimes much longer.

Peduncle scales: In the subtropical and temperate species of *Herminium*, foliaceous peduncle scales are present (e.g. *H. lanceum*, *H. latilabre*, *H. edgeworthii*, *H. fallax*) but in several subalpine and alpine species, such as *H. pugioniforme*, *H. josephi*, and *H. fimbriatum*, they are absent.

Figure 6. Dorsal sepal of *Herminium*. **A** *H. monorchis* **B** *H. chloranthum* **C** *H. pygmaeum* **D** *H. josephi* **E** *H. monophyllum* **F** *H. lanceum* **G** *H. macrophyllum* **H** *H. glossophyllum* **I** *H. coeloceras*.

Floral bracts: Most species have floral bracts, except *Herminium humidicola*, in which they are lacking. The shape of the floral bracts shows some variation. They can be ovate or triangular as in *H. albomarginatum*, *H. oxysepalum*, and *H. chloranthum*; reduced to tiny scales as in *H. pugioniforme* and *H. biporosum*; or they can be lanceolate as in *H. monorchis*, *H. lanceum*, and *H. fallax*. Floral bracts may be (sub) equal to the ovary as in *H. josephi*, *H. himalay anum* or distinctly shorter, or longer, as in *H. clavigerum*.

Figure 6. Continued. Dorsal sepal of *Herminium*. **J** *H. fallax* **K** *H. handelii* **L** *H. elisabethae* **M** *H. himalayanaum* **N** *H. clavigerum* **O** *H. quinquelobum* **P** *H. macrophyllum* **Q** *H. mannii* **R** *H. biporosum*.

Ovary: Like all orchids, *Herminium* has an inferior ovary, which may be sessile or pedicelate, straight to arcuate, or twisted as in *H. biporosum*. Its shape ranges from cylindrical to fusiform. The ovary is usually beaked (abruptly tapered) at the apex. In *Herminium monorchis* and closely related species (*H. ophioglossoides*, *H. pygmaeum*) the ovaries are beaked and decurved.

Figure 7. Lateral sepal of *Herminium*. **A** *H. monorchis* **B** *H. chloranthum* **C** *H. pygmaeum* **D** *H. josephi* **E** *H. monophyllum* **F** *H. lanceum* **G** *H. macrophyllum* **H** *H. glossophyllum* **I** *H. coeloceras*.

Flower: Most species of *Herminium* have inflorescence with spirally arranged flowers, but several have subsecund flowers, e.g. *H. monophyllum* (Fig. 5). The flowers are resupinate (rarely not resupinate), small, usually pale to yellowish green as in *Herminium monorchis*, *H. chloranthum*, but sometimes white (*H. coeloceras*, forms of *H. macrophyllum*), whitish-green (e.g. *H. mackinnonii*, *H. jaffreyanum*), or rarely more

Figure 7. Continued. Lateral sepal of *Herminium*. **J** *H. fallax* **K** *H. gracile* **L** *H. elisabethae* **M** *H. himalayanicum* **N** *H. clavigerum* **O** *H. quinquelobum* **P** *H. macrophyllum* **Q** *H. lanceum* **R** *H. biporosum*.

colorful, as in the white-and-red *H. albosanguineum*. In some species the flowers open only slightly (e.g. *H. humidicola*).

Dorsal sepal: Always concave. It can be ovate (e.g. *H. josephi*, *H. souliei*, *H. alaschanicum*, *H. macrophyllum*), elliptic to ovate-oblong (e.g. *H. fallax*, *H. latilabre*, *H. monorchis*, *H. quinquelobum*), or lanceolate-oblong (*H. quinquelobum*, *H. ophioglossoides*, *H. glossophyllum*) (Fig. 6). Some alpine species (e.g. *H. humidicola* and

Figure 8. Petal of *Herminium*. **A** *H. monorchis* **B** *H. chloranthum* **C** *H. pygmaeum* **D** *H. josephi* **E** *H. monophyllum* **F** *H. lanceum* **G** *H. josephi* **H** *H. coiloglossum* **I** *H. coeloceras*.

H. biporosum) have a nearly orbicular dorsal sepal. The dorsal sepal may be spreading, as in *H. monophyllum* and *H. mackinnonii*, or connivent with the lateral sepals or petals forming a hood, as in *H. biporosum*, *H. lanceum*, *H. chloranthum*, *H. elisabethae*, *H. fallax*, and *H. alaschanicum*.

Lateral sepals: The shape of lateral sepals is rather variable: oblong-obovate (*H. monorchis*), ovate-oblong (*H. lanceum*), ovate-lanceolate (*H. fallax* and *H. alaschani-*

Figure 8. Continued. Petal of *Herminium*. **J** *H. fallax* **K** *H. himalayanum* **L** *H. elisabethae* **M** *H. alaschanicum* **N** *H. ophioglossoides* **O** *H. quinquelobum* **P** *H. macrophyllum* **Q** *H. ecalcaratum* **R** *H. biporosum*.

cum), oblong-lanceolate (*H. macrophyllum*), ovate (*H. latilabre* and *H. elisabethae*), ovate to elliptic (*H. pugioniforme*), obliquely elliptic (*H. chloranthum*), or elliptic-oblong to elliptic-lanceolate (*H. clavigerum*) (Fig. 7). In most species, lateral sepals are spreading but they are completely reflexed in *H. clavigerum*, *H. latilabre*, *H. edgeworthii*, and *H. pugioniforme*; in *H. gracile* they are reflexed so as to become parallel to the

Figure 9. Lip of *Herminium*. **A** *H. monorchis* **B** *H. chloranthum* **C** *H. pygmaeum* **D** *H. josephi* **E** *H. monophyllum* **F** *H. macrophyllum* **G** *H. macrophyllum* **H** *H. alaschanicum* **I** *H. coeloceras*.

lip. In *H. latilabre*, *H. edgeworthii*, and *H. clavigerum*, the lateral sepals have ciliate margins, whereas these are denticulate in *H. oxysepalum*.

Petals: Connivent with the dorsal sepals, except in *H. jaffreyanum*, *H. monophyllum*, *H. quinquelobum* and some other species, which have free, spreading petals. Their shape varies considerably: linear (*H. fallax*, *H. lanceum*, *H. souliei*, *H. quinquelobum*,

Figure 9. Continued. Lip of *Herminium*. **J** *H. fallax* **K** *H. longilobatum* **L** *H. elisabethae* **M** *H. alaschanicum* **N** *H. lanceum* **O** *H. quinquelobum* **P** *H. kamengense* **Q** *H. coiloglossum* **R** *H. biporosum*.

H. mackinnonii, *H. jaffreyanum*, *H. monophyllum*), lanceolate (*H. chloranthum*, *H. pygmaeum*), oblong-lanceolate (*H. ophioglossoides*), ovate-lanceolate (*H. macrophyllum*, *H. josephi*, *H. elisabethae*), ovate to broadly ovate (*H. biporosum*, *H. coeloceras*, *H. macrophyllum*, *H. ecalcaratum*), oblong (*H. coiloglossum*), rhombic (*H. monorchis*), or spatulate (*H. himalayanum*) (Fig. 8).

Figure 10. Column structure in *Herminium*. **A** *H. monorchis* **B** *H. josephi* **C** *H. latilabre* **D** *H. monophyllum* **E** *H. kamengense* **F** *H. longilobatum* **G** *H. himalayana* **H** *H. mannii* **I** *H. fallax*.

Lip: Usually 3-lobed and with a concave and ecallose basal part that may be dilated as in *H. coiloglossum*, *H. lanceum* or not dilated as in *H. alaschanicum*. Some species, such as *H. coeloceras*, have a callus on the lip. In a few species the lip is entire, as in *H. monophyllum*, or 5-partite, as in *Herminium quinquelobum*. The shape of the lip may be ovate (*H. josephi*), oblong (*H. lanceum*), lingulate (e.g. *H. biporosum*, *H. latilabre*), or ovate-lanceolate (e.g. *H. macrophyllum*) (Fig. 9).

Figure 11. Pollinia structure in *Herminium*. **A** *H. josephi* **B** *H. macrophyllum* **C** *H. pygmaeum* **D** *H. handelii* **E** *H. lanceum* **F** *H. fallax* **G** *H. forceps* **H** *H. latilabre* **I** *H. coeloceras*.

Spur: Lacking in most of the species, but a significant minority have a spurred lip (*H. alaschanicum*, *H. albomarginatum*, *H. albosanguineum*, *H. albovirens*, *H. bulleyi*, *H. clavigerum*, *H. edgeworthii*, *H. quinquelobum*, *H. fallax*, *H. fimbriatum*, *H. forceps*, *H. handelii*, *H. himalayanicum*, *H. humidicola*, *H. latilabre*, *H. mannii*, *H. singulum*, and *H. suave*). The spur may be cylindrical (e.g. *H. edgeworthii*) or scrotiform (*H. alaschanicum*, *H. quinquelobum*, *H. fallax*). It is usually shorter than the ovary (e.g. *H.*

alaschanicum, *H. quinquelobum*, *H. forceps*) but in a few species the spur is longer than the ovary (e.g. *H. latilabre*, *H. edgeworthii*) (Fig. 5). In some species, such as *H. josephi*, *H. monorchis*, *H. ophioglossoides*, and *H. pygmaeum*, the lip has a saccate base, which can be almost like a spur.

Column: Short but well-developed (Fig. 10). The anther is adnate to the column apex, 2-locular, with the locules parallel or divergent. Pollinia 2, oblong to ellipsoid, granular-farinaceous and sectile, with very short or vestigial caudicles. Viscidia globose (*H. lanceum*, *H. longilobatum*) or often involute, naked and hornlike (*H. alaschanicum*, *H. josephi*, *H. monorchis*) (Fig. 11). Rostellum triangular, often with arms. Stigma lobes 2, free, sometimes confluent, usually clavate and raised, in some species, such as *H. albomarginatum* and *H. pugioniforme*, pulvinate; in *H. latilabre* and closely related species the stigma lobes are extended along the entrance of the spur, but not adnate to the lip base as in *Peristylus*. There are two, usually prominent auricles laterally at the base of the anther.

Fruits: A capsule; longitudinally dehiscent; usually erect, beaked, oblong or fusiform, in some species it may be twisted.

Ecology

Almost all species of *Herminium* are terrestrial, but a few, such as *H. lanceum* (Thunb. ex Sw.) Vuijk, *H. mackinnonii* Duthie and *H. quinquelobum* King & Pantl., occasionally grow as epiphytes on tree trunks or major branches of large trees (Fig. 2). Forests, woodlands and grasslands are a common habitat of *Herminium*, where the species grow in humus-rich soil in light shade. Many species are subalpine or alpine, growing fully exposed in high mountain valleys and meadows (e.g. *H. albomarginatum*, *H. josephi*, *H. monorchis*, *H. pugioniforme*) or on peaty soil in moraine areas (e.g. *H. alaschanicum*, *H. chloranthum*).

Herminium pugioniforme appears to reach the highest elevation of any orchid, said to occur up to 5500 m (Pridgeon et al. 2001; but see note under *H. pugioniforme* below). In contrast, *H. monorchis* grows at sea level in part of its range, e.g. in The Netherlands. In tropical and subtropical regions, all *Herminium* species are mountain plants, with many species growing at an elevation of around 4000 m (Fig. 3). A few species, such as *H. lanceum*, *H. souliei* and *H. monorchis*, have a wide distributional range, but many more, about one quarter of the species, are narrow endemics, including *H. albosanguineum*, *H. handelii*, *H. kamengense*, *H. oxysepalum*, and *H. pygmaeum*.

Little, if anything, is known about the pollination of nearly all species of *Herminium*. Only that of *H. monorchis* has been thoroughly studied (Nilsson 1979; Claessens and Kleynen 2016). The honey-scented flowers of this taxon produce small quantities of nectar and attract various species of minute insect, in particular parasitic wasps, flies, mosquitos and even beetles (Claessens and Kleynen 2016). The most important pollinators in Sweden were found to be female parasitic wasps of the genus *Tetrastichus* (Nilsson, 1979), which accounted for 65% of pollinia transfers, with other parasitic wasps accounting for

12.2%, while Diptera only accounted for 7.8%. Most *Herminium* species are superficially similar to *H. monorchis*, in that they have small greenish flowers, and they may have similar pollinators. A few species with longer spurs and larger, *Platanthera*-like flowers (here included in the new section *Pseudoplatanthera*), may well be moth-pollinated.

Phenology

In the Pan-Himalayan region, vegetative growth of *Herminium* species starts in March–May and flower buds appear in June. Flowering begins in June and reaches its peak in August. Fruiting occurs largely simultaneously with the flowering time. Leaf and stem decay in November–December. In the middle of winter, i.e. during December to February, plants of *Herminium* are dormant, surviving as subterranean tubers.

Thisbe Falc. in Lindl., Veg. Kingd., ed. 2: 183c. 1847, *nom. inval.*

Type species. *Herminium monorchis* (L.) R.Br.

Description. Herbs; terrestrial or occasionally epiphytic. Tubers unbranched, globose to oblong-ellipsoid. Stem erect, one-to several-leaved. Leaves basal to cauline. Inflorescence racemose or rarely subcorymbose. Flowers erect, horizontal, or nodding; ovary and pedicel straight or arcuate, beaked. Sepals subequal; dorsal sepal connivent with petals and forming a hood; lateral sepals spreading, oblique. Petals usually thickened and fleshy; lip base shallowly concave, saccate or shortly spurred. Column very short; pollinia 2, granular-farinaceous, sectile, each attached to a viscidium via caudicle; viscidia often involute and horn-like, naked; rostellum triangular, with arm-like lobes; stigma lobes 2, free, raised, clavate or pulvinate; staminodes 2, usually prominent. Fruit usually erect, oblong to fusiform.

Infrageneric classification

Based on the phylogeny in Raskoti et al. (2016) and previous classifications of Lang (1988), Pridgeon et al. (2001), and Agrawala et al. (2010), we here propose the following infrageneric classification.

I. *Herminium* sect. *Herminium*

Note. Ovary rostrate, with the apex hook-like bent sideways or downwards (not always clearly so in *H. monophyllum*). Lip with or without a short spur, entire or lobed.

Type species. *Herminium monorchis* (L.) R.Br.

Species. 1. *H. alaschanicum*, 6. *H. bulleyi*, 7. *H. chloranthum*, 9. *H. coeloceras*, 13. *H. elisabethae*, 16. *H. forceps*, 17. *H. glossophyllum*, 24. *H. josephi*, 27. *H. kumaunense*, 32. *H. macrophyllum*, 33. *H. mannii*, 34. *H. monophyllum*, 35. *H. monorchis*, 36. *H. neotineaoides*, 37. *H. ophioglossoides*, 42. *H. pygmaeum*, 43. *H. singulum*, 46. *H. tangianum*, 47. *H. tibeticum*.

II. *Herminium* sect. *Thisbe* X.H. Jin, Schuit. & Raskoti, sect. nov.

urn:lsid:ipni.org:names:77161966-1

Note. Ovary not with hooked-rostrate apex; lip not spurred, 2-, 3-, or 5-lobed.

Type species. *Herminium lanceum* (Thunb. ex Sw.) Vuijk, here designated.

Species. 10. *H. coiloglossum*, 11. *H. ecalcaratum*, 21. *H. hongdeyuanii*, 23. *H. jafreyanum*, 26. *H. kamengense*, 28. *H. lanceum*, 30. *H. longilobatum*, 31. *H. mackinnonii*, 42. *H. quinquelobum*, 45. *H. souliei*, 49. *H. yunnanense*.

III. *Herminium* sect. *Androcorys* (Schltr.) X.H. Jin, Schuit. & Raskoti, stat. nov.

urn:lsid:ipni.org:names:77161967-1

Basionym. *Androcorys* Schltr., Repert. Spec. Nov. Regni Veg. Beih. 4: 52. 1919.

Note. Ovary not with hooked-rostrate apex; lip not spurred, entire, usually abruptly dilated at the base; anther-connective forming a hood over the thecae.

Type species. *Androcorys ophioglossoides* Schltr. (= *Herminium gracile* King & Pantl.)

Species. 5. *H. biporosum*, 18. *H. gracile*, 25. ?*H. kalimpongense*, 38 *H. oxysepalum*, 39. *H. pugioniforme*, 40. *H. pusillum*, 48. *H. wangianum*.

Note. The aberrant *H. kalimpongense* Pradhan may not belong to this section (see discussion under *Herminium kalimpongense*).

IV. *Herminium* sect. *Bhutanthera* (J.Renz) X.H. Jin, Schuit. & Raskoti, stat. nov.
 urn:lsid:ipni.org:names:77161968-1

Basionym. *Bhutanthera* J. Renz, Edinburgh J. Bot. 58: 99. 2001.

Note. Ovary not with hooked-rostrate apex; lip spurred, 3-lobed; stigma cushion-like, not projecting beyond rostellum.

Type species. *Herminium albomarginatum* (King & Pantl.) X.H. Jin, Schuit., Raskoti & L.Q. Huang

Species. 2. *H. albomarginatum*, 3. *H. albosanguineum*, 4. *H. albovirens*, 15. *H. fimbriatum*, 19. *H. handelii*, 20. *H. himalayanum*, 22. *H. humidicola*.

V. *Herminium* sect. *Cybele* X.H. Jin, Schuit. & Raskoti, sect. nov.
 urn:lsid:ipni.org:names:77161969-1

Note. Plant 1-leaved; ovary not with hooked-rostrate apex; lip spurred, 3-lobed; stigma lobes projecting beyond rostellum.

Type species. *Herminium fallax* (Lindl.) Hook. f., here designated.

Species. 14. *H. fallax*.

VI. *Herminium* sect. *Pseudoplatanthera* X.H. Jin, Schuit. & Raskoti, sect. nov.
 urn:lsid:ipni.org:names:77161970-1

Note. Plant 2- or more-leaved; ovary not with hooked-rostrate apex; lip spurred, entire; stigma lobes projecting beyond rostellum.

Type species. *Herminium clavigerum* (Lindl.) X.H. Jin, Schuit., Raskoti & L.Q. Huang, here designated.

Species. 8. *H. clavigerum*, 12. *H. edgeworthii*, 29. *H. latilabre*, 45. *H. suave*.

Key to the species

- 1 Ovary apex hooked sideways or downward, distinctly rostrate 2
- Ovary apex straight or not distinctly rostrate 20
- 2 Plant with one or more leaves; lip with concave or saccate to globose base... 3
- Plant with two or more leaves; lip with distinct clavate or cylindrical spur... 15
- 3 Lip entire or lateral lobes obscure..... 4
- Lip 3-lobed with distinct lateral lobes 7
- 4 Plant with single leaf; lip without callus 34. *H. monophyllum*
- Plant with two or more leaves; lip with or without callus 5
- 5 Lip pandurate 46. *H. tangianum*
- Lip triangular to ovate 6

- 6 Flower green; lip deflexed, 3.5–5 mm long, in basal half of the blade with two parallel longitudinal keels; sac reduced to a slight bulge at the base of the lip....
.....**24. *H. josephi***
- Flower white or green; lip subpatent to deflexed, 1.6–3.5 mm long, ecallose or with a single callus on the blade; sac subglobose **32. *H. macrophyllum***
- 7 Lip pandurate or subpandurate.....**8**
- Lip not pandurate.....**11**
- 8 Petal constricted in the middle, lip lobes obscure **27. *H. kumaunense***
- Petal not constricted in the middle, lip with distinct lobes**9**
- 9 Leaves oblong, elliptic or spatulate, petal elliptic-lanceolate, lip fiddle-shaped**7. *H. chloranthum***
- Leaves linear-oblong or lanceolate, petal trullate, lip not fiddle-shaped**10**
- 10 Leaves linear-oblong, peduncle with lanceolate peduncle-scales, lip without callus.....**42. *H. pygmaeum***
- Leaves lanceolate, peduncle without peduncle-scales, lip with two longitudinal calli **47. *H. tibeticum***
- 11 Flower white or green; lip with a large callus.....**12**
- Flower yellowish green; lip without callus**13**
- 12 Lip lateral lobes oblong, callus not papillose**9. *H. coeloceras***
- Lip lateral lobes lanceolate, callus papillose**36. *H. neotineseoides***
- 13 Petals not abruptly narrowed above the middle, lip base with a tiny globose spur **17. *H. glossophyllum***
- Petal abruptly narrowed above the middle, lip base lacking spur **14**
- 14 Plant with two or more leaves, petals rhombic-caudate, c. 3 times longer than wide, lip side-lobes about half as long as the mid-lobe **35. *H. monorchis***
- Plant with one leaf, petals lanceolate-caudate, c. 6–8 times longer than wide, lip side-lobes about 3/4 as long as the mid-lobe **37. *H. ophioglossoides***
- 15 Lip entire.....**16**
- Lip 3-lobed.....**17**
- 16 Plant with more than one well-spaced oblong-lanceolate leaf, lateral sepals oblong-lanceolate.....**16. *H. forceps***
- Plant with a single basal elliptic leaf, lateral sepals obliquely ovate... **43. *H. singulum***
- 17 Leaves elliptic, oblong to lanceolate, petals ovate, oblique**13. *H. elisabethae***
- Leaves linear **18**
- 18 Floral bracts longer than the ovary, petals oblong-lanceolate, abruptly narrowed above middle.....**1. *H. alaschanicum***
- Floral bracts shorter than the ovary.....**19**
- 19 Spur scrotiform, shorter than ovary, petals ovate-lanceolate....**33. *H. mannii***
- Spur cylindrical, longer than ovary and pedicel, petals oblong-lanceolate.....
.....**6. *H. bulleyi***
- 20 Lip not spurred, though possibly with a semiglobose saccate base, possibly dilated at base**21**
- Lip spurred, not dilated at base.....**39**

21	Lip 2-, 3-, or 5-partite.....	22
–	Lip entire.....	32
22	Petals ovate	23
–	Petals linear or oblong.....	24
23	Plant with single basal linear-oblong leaf, flower yellowish-green	49. <i>H. yunnanense</i>
–	Plants with two alternate oblong leaves, flower white.....	11. <i>H. ecalcaratum</i>
24	Petals spreading, white.....	25
–	Petals connivent with dorsal sepal, yellowish green.....	27
25	Lip 5-lobed, lateral sepals oblong, petals linear.....	42. <i>H. quinquelobum</i>
–	Lip 3-lobed, lateral sepals ovate-lanceolate or ovate-oblong, petals lanceolate or linear-lanceolate.....	26
26	Lateral lobes of lip reduced or sometimes absent, lateral sepals ovate-lanceolate.....	23. <i>H. jaffreyanum</i>
–	Lateral lobes of lip distinctly developed, lateral sepals ovate-oblong	31. <i>H. mackinnonii</i>
27	Lateral lobes of lip falcate.....	28
–	Lateral lobes of lip straight.....	29
28	Plant with single leaf, petals oblong	10. <i>H. coiloglossum</i>
–	Plant with two or more leaves, petals linear.....	45. <i>H. souliei</i>
29	Lip broadly ovate, petals slightly falcate	26. <i>H. kamengense</i>
–	Lip oblong, petals not falcate	30
30	Lip with a callus, lateral lobes coiled at anthesis	30. <i>H. longilobatum</i>
–	Lip without callus, lateral lobes not coiled	31
31	Peduncle not winged, lateral lobes longer than mid-lobe.....	28. <i>H. lanceum</i>
–	Peduncle winged, lateral petals shorter than mid-lobe...21. <i>H. hongdeyuanii</i>	
32	Leaf cordate, fleshy, with reticulate markings, flower white ...25. <i>H. kalimpongense</i>	
–	Leaf not cordate, not fleshy, without markings, flower greenish	33
33	Lip with two sharply delimited pits at base, or with concave basal part separated into two cavities by a longitudinal callus ridge	34
–	Lip without pits or cavities at base, possibly with two shallow depressions, but these not sharply delimited or separated by a callus ridge.....	36
34	Anther-channels elongate, pollinia with well-developed caudicles; lateral sepals deflexed, held parallel with the lip.....	18. <i>H. gracile</i>
–	Anther channels very short, caudicles very short; lateral sepals patent, at about right angles to the lip	35
35	Inflorescence relatively lax: distance between at least some of the successive flowers about as long as or longer than the ovary; lateral sepals 3 mm long, lip 2.8–3 mm long.....	5. <i>H. biporosum</i>
–	Inflorescence dense: distance between successive flowers less than half as long as the ovary; lateral sepals 1.5–1.8 mm long, lip 1.4–1.8 mm long ...39. <i>H. pugioniforme</i>	
36	Margins of lateral sepals ciliate or dentate	37
–	Margins of lateral sepals glabrous and smooth.....	38

- 37 Lateral sepals ciliate, petals oblong **40. *H. pusillum***
 – Lateral sepals dentate, petals oblong-lanceolate **38. *H. oxysepalum***
 38 Floral bracts shorter than the ovary; lip linear-ligulate, dilated at base
 **48. *H. wangianum***
 – Floral bracts at least in the lower flowers as long as or longer than the ovary;
 lip ovate **34. *H. monophyllum***
 39 Stigma not cushion like, projecting beyond the rostellum; lip entire or
 3-lobed **40**
 – Stigma cushion like, situated underneath the rostellum; lip 3-lobed **44**
 40 Plant with one leaf, lip 3-lobed **14. *H. fallax***
 – Plant with more than one leaf, lip entire, lingulate **41**
 41 Spur shorter than pedicel and ovary **8. *H. clavigerum***
 – Spur equal to or longer than pedicel and ovary **42**
 42 Spur pointing upwards **12. *H. edgeworthii***
 – Spur pointing downwards **43**
 43 Leaves ovate to oblong, apex acute, spur longer than ovary **29. *H. latilabre***
 – Leaves linear, apex acuminate, spur equal to or shorter than ovary
 **45. *H. suave***
 44 Inflorescence subcorymbose, floral bracts absent **22. *H. humidicola***
 – Inflorescence racemose, floral bract present **45**
 45 Lateral lobes of lip much reduced, distinctly shorter than the mid-lobe
 **19. *H. handelii***
 – Lateral lobes of lip distinct, nearly equal to the mid-lobe **46**
 46 Leaves opposite, apex of the dorsal sepal fimbriate **15. *H. fimbriatum***
 – Leaves subopposite or distant, apex of the dorsal sepal not fimbriate **47**
 47 Inflorescence 1–2-flowered **48**
 – Inflorescence 3- or more-flowered **49**
 48 Sepals white, petals and lip red **3. *H. albosanguineum***
 – Sepals green, petals greenish or white, lip white **4. *H. albovirens***
 49 Sepals white; inflorescence 3–4-flowered **20. *H. himalayanum***
 – Sepals green with white margins; inflorescence 5–20-flowered
 **2. *H. albomarginatum***

1. *Herminium alaschanicum* Maxim., Bull. Acad. Imp. Sci. Saint-Petersbourg 31: 105. 1887.

Figs 8M, 9M

Monorchis alaschanica (Maxim.) O. Schwarz, Mitt. Thüring. Bot. Ges. 1: 95. 1949.

Peristylus alaschanicus (Maxim.) N. Pearce & P.J. Cribb, Edinburgh J. Bot. 58: 117. 2001.

Type. MONGOLIA. Mont. Alaschan, 1873, *Przewalski N.M.*, 163 (Holotype: LE! [LE01012203]; Isotype: K! [K000079038]).

Description. Plant 13–68 cm tall. Tubers oblong, $1\text{--}1.5 \times \text{ca. } 0.5\text{--}1$ cm. Stem with 2 or 3 tubular sheaths at base, 3–4-leaved. Leaves linear-lanceolate, $2\text{--}15 \times 0.4\text{--}1$ cm, apex acuminate. Inflorescence 14–34 cm; peduncle cylindrical, with 3–5 lanceolate peduncle-scales 5–15 mm; rachis 4–8 cm, laxly many-flowered; floral bracts ovate-lanceolate, 5–26 mm, longer than ovary, apex cuspidate. Flowers green; pedicel and ovary twisted, beaked and much hooked toward apex, 5–15 mm. Dorsal sepal oblong-lanceolate, $3\text{--}3.5 \times 1.2\text{--}3$ mm, apex obtuse; lateral sepals oblong-lanceolate, $3\text{--}3.5 \times 1.2\text{--}2$ mm, apex subacute. Petals ovate-lanceolate, falcate, $3.2\text{--}5 \times 1.1\text{--}1.5$ mm, narrowed above middle, fleshy, apex cuspidate. Lip oblong, $4\text{--}5.5 \times 1.2\text{--}1.5$ mm, base concave, spurred, 3-lobed near middle; lateral lobes linear, 2.5×0.3 mm; mid-lobe linear-triangular, 1.5×0.5 mm, apex acute. Column 1 mm; pollinia obovoid; caudicles very short, viscidia involute, hornlike, rostellum triangular, armed, stigma transversely oblong, situated below the rostellum.

Flowering time. June–September.

Habitat. Terrestrial in *Quercus-Abies* forests, dry stony slopes, alpine meadows and valleys at elevations of 1800–4500 m.

Distribution. China, Mongolia, Nepal.

Specimens examined. CHINA: **Gansu**, Tianzhu county, Leigong mountain, 2800 m, 09.07.1964, *Sino-Soviet Team*, 758 (PE); Min Hsien, 2500 m, 07.07.1936, *Wang Z. Type. INDIA. Sikkim, Singalila, 13000 ft, 07.1896, *Pantling R.*, 450 (Holotype: K! [K000387527]).

Description. Plant 10–14 cm tall. Tuber globose, 0.6–1.4 × 0.7–1.3 cm. Stem sheathed, 6.5–11 cm long, 2-leaved, sheaths tubular, ovate, obtuse, 2–3.5 × 0.6–0.7 cm. Leaves distant, orbicular-elliptic, obtuse shortly sheathing at base, 3–5 × 1.3–2.4 cm. Inflorescence 5–20-flowered, rachis 1–3 cm long, floral bracts lanceolate, 1–2 × 0.3–0.4 cm, upper bracts triangular, 1–1.5 mm long. Flower white, sepal green with white margin, ovary 4–6 mm, sessile, beaked. Dorsal sepal broadly elliptic-ovate, obtuse, 4 × 2.5 mm, lateral sepal elliptic-ovate, obtuse, 4 × 3 mm. Petal suborbicular, concave, 2 × 1 mm. Lip 3-lobed, 2 × 1 mm, lateral lobes oblong, mid-lobe oblong, obtuse, spur cylindrical, 2 mm long. Column 1.5 mm tall, pollinia clavate-elliptic, 1–1.2 mm, rostellum triangular, stigma pulvinate.

Flowering time. July–September.

Habitat. Terrestrial in alpine meadows and on grassy slopes at elevations of 3720–4270 m.

Distribution. India, Nepal

Specimens examined. INDIA: **Sikkim**, Nathang, 13.07.1877, *King*, 4367 (K); Sikkim, Tsomgo Chho, 08.07.1996, *Long and Noltie*, 71 (E); Sikkim, Yampung, 12.08.1913, *Rohmoo*, 1098 (E).

NEPAL: **Bagmati**, Rasuwa, Above Rupche Bhanjyang, Ganesh Himal, 3600 m, 02.07.1992, *Baker W. J.*, *Burkitt T. A.*, *Miller J. T* and *Shrestha R.*, 9 (KATH).

3. *Herminium albosanguineum* (Renz) X.H. Jin, Schuit., Raskoti & L.Q. Huang, Cladistics 2015.

Basionym. *Bhutanthera albosanguinea* Renz, Edinburgh J. Bot. 58: 101. 2001.

Type. BHUTAN. Thimphu district, Darkey Pang Tso, north of the Paro, *Wood J.R.*, 7405 (Holotype: E! [E00008001]).

Description. Plant 4.5 cm tall. Tuber not seen. Stem with tubular sheaths at base, 2-leaved. Leaves lanceolate, acute, 2.3–2.5 × 0.4–0.8 cm. Inflorescence terminal, racemose, 2-flowered; rachis 1 cm long; floral bract triangular. Flowers 1–1.3 cm across; sepals white, petals and lip red; pedicel and ovary twisted, 7–9 mm long. Dorsal sepal elliptic-obovate, rounded, margins glandular, 5 × 4 mm; lateral sepals elliptic, subacute, 6 × 4 mm. Petals spatulate, rounded, cucullate at apex, 5 × 2.2 mm (at wide apex). Lip 3-lobed, narrowed and subunguiculate at base, spurred, base 1 × 1 mm; lateral lobes lingulate, obtuse, 3 × 1 mm; mid-lobe lingulate, obtuse, 3 × 1 mm; spur conical, 2 mm long. Column short, 1.5–2 × 1.5 mm; pollinaria 1.6 mm long. Fruit not seen.

Flowering time. August.

Habitat. Terrestrial on rock crevices or cliffs at an elevation of 4100 m.

Distribution. Endemic to Bhutan.

Note. Our description is based on Pearce and Cribb (2001) and an image of the holotype, which is apparently the only collection made of this species so far. *Herminium albosanguineum* is similar to *H. albomarginatum*, but differs in having a fewer-flowered inflorescence, white sepals, red petals and lip. It is also similar to *H. albovirens*; see under that species for a comparison.

4. *Herminium albovirens* (Renz) X.H. Jin, Schuit., Raskoti & L.Q. Huang, Cladistics 2015.

Basionym. *Bhutanthera albovirens* Renz, Edinburgh J. Bot. 58: 102. 2001.

Type. BHUTAN. Tongsa district, Thita Tso, Rinchen Chu, 13. 07. 1937. *Ludlow and Sherriff, 3441* (Holotype: BM! [BM000074511]).

Description. Plant 4–6 cm tall. Tuber globose, 0.5–1 × 0.4–0.5 cm. Stem with 2 leaves and tubular sheaths. Leaves subopposite, lanceolate to ovate-lanceolate, subacute, 1–1.9 × 0.4–1.1 cm. Inflorescence terminal, 1–2-flowered; floral bract lanceolate, acuminate, 3 × 0.5–1 mm. Flowers white, sepals and petals yellowish green, 0.8–1 cm across; pedicel and ovary fusiform, 6–8 mm long. Dorsal sepal ovate, obtuse, 5 × 3.5 mm; lateral sepals obliquely ovate, falcate, subacute, 6–6.5 × 3–4 mm. Petals obovoid, rounded, 3–5 × 2.5–4 mm. Lip deeply 3-lobed, spurred, base quadrate, 0.5 × 2 mm (wide); lateral lobes oblong, rounded, 3.5–4 × 0.8 mm; mid-lobe oblong, rounded, 5 × 0.6 mm; spur conical, globose, rounded, curved forwards, 2–3 × 0.8–1 mm. Column short, broad, 1 mm tall; anther-cap long-beaked, 1.5–1.9 mm long.

Flowering time. July–September.

Habitat. Terrestrial on alpine cliffs and in rock crevices at elevations of 4270–4720 m.

Distribution. Endemic to Bhutan.

Specimen examined. BHUTAN: Upper Kulong Chi district, Shingbe, 17.09.1949, *Ludlow & Sherriff, 21196* (BM! [BM000074510]).

Note. Our description is based on Pearce and Cribb (2001) and an image of the holotype. *Herminium albovirens* is similar to *H. albosanguineum*, but differs in having yellowish-green sepals, yellowish-green to white petals and a white lip. More material of these species is needed to assess their variability.

5. *Herminium biporosum* Maxim., Bull. Acad. Imp. Sci. Saint-Pétersbourg, sér. 3, 31: 106. 1886.

Figs 6R, 7R, 8R, 9R

Porolabium biporosum (Maxim.) Tang & F. T. Wang, Bull. Fan Mem. Inst. Biol. Bot. 10: 38. 1940.

Monorchis biporosa (Maxim.) O. Schwarz, Mitt. Thüring. Bot. Ges. 1: 95. 1949.

Type. CHINA. Qinghai, near Lake Khuku-nor, 1880, *Przewalski, Spec. 1* (Holotype: LE!).

Description. Plant 5–12 cm tall. Tubers globose, 6 × 4 mm. Stem slender, with 2 or 3 tubular sheaths and 1 leaf. Leaf oblong-lanceolate, 1–3.5 × 0.4–0.6 cm, apex obtuse. Inflorescence 2–10 cm, peduncle cylindrical without peduncle-scales, rachis 1–4 cm with 4–8-flowered; floral bracts scale like, ca. 1 mm. Flowers yellowish green; ovary twisted, fusiform, including pedicel 5–6 mm. Dorsal sepal forming a hood with petals, orbicular, 2.5 × 1.5 mm, apex obtuse; lateral sepals obliquely oblong-lanceolate, 3 × 1.5 mm, apex obtuse. Petals ovate, oblique, 2 × 1 mm. Lip deflexed, 1.5–2.8 × 1.5 mm, base dilated and with 2 sharply delimited pits, attenuate toward apex. Column 0.7 mm, with 2 lateral appendages at base of anther; anther cucullate, large, 2-locular; pollinia 2, each attached to a viscidium by a short caudicle; rostellum triangular, with spreading lateral lobes; stigma cushion situated below the rostellum. Fruit fusiform, 5 mm long.

Flowering time. July.

Habitat. Terrestrial on grasslands slopes at elevations of 3000–3600 m.

Distribution. China (Qinghai, Shanxi, Yunnan).

Specimen examined. CHINA: **Yunnan**, Fugong county, 3600 m, 17.07.2013, *Jin X.H., Wang L.S., Wang Q et al.*, ST0437 (PE).

Basionym. *Habenaria bulleyi* Rolfe, Notes Roy. Bot. Gard. Edinburgh 8: 25. 1913.

Type. CHINA. Yunnan, eastern slopes of the Tsan-Shan Range, west of Talifu, 7800 ft, 15.09.1905, *Forrest G.*, 895 (Holotype: E! [E00059069]).

Description. Plant slender, 15–30 cm tall. Tubers oblong, 1–3.5 × ca. 0.5–1 cm. Stem with 2 tubular sheaths, 2–4 leaved. The two lowest leaves subopposite, others more distant, linear, 4–10 × 0.2–0.6 cm, apex acute or acuminate. Inflorescence 15–25 cm; peduncle cylindrical, slender; peduncle-scales 1–3, linear-lanceolate, 5–7 mm; rachis 5–15 cm, laxly many-flowered; floral bracts ovate-lanceolate, 4–6 mm, shorter than ovary, apex acuminate. Flowers yellowish green, secund; pedicel and ovary 5–10 mm, apex beaked. Dorsal sepal ovate-oblong, concave, 1.5–3.5 × 0.6–1.2 mm, apex obtuse; lateral sepals oblong, oblique, 3–4 × 0.8–1.5 mm, apex obtuse. Petals ovate-lanceolate, ca. 3.5 × 1.5 mm, fleshy above middle, apex acute. Lip narrowly oblong, 3–4.5 × ca. 0.4 mm,

3-lobed near middle; lateral lobes oblong, 0.6–2.5 mm; mid-lobe linear-oblong, 2–3 mm, wider than lateral lobes, apex obtuse; spur pendulous, curved forward, cylindrical, 4–6 mm, equal or longer than ovary, apex dilated, obtuse. Column ca. 1 mm; viscidia ellipsoid, rostellum triangular, stigma ca. 1 mm, drawn out at the base of the lip.

Flowering time. July–September.

Habitat. Terrestrial in forest margins, in dry pastures in open pine forest, or on grassy slopes at elevations of 2500–3500 m.

Distribution. China (Sichuan, Yunnan).

Specimens examined. CHINA: **Sichuan**, Daocheng county, Riwaogongshe, Xiayong, 3300 m, 24.08.1981, *Hengduan Mountain Team*, 4193 (PE); Daocheng, 3500 m, 18.08.1973, *Sichuan Botanical Survey Team*, 2534 (PE); Muli, 03.08.1937, *Yu T. Type. CHINA. Yunnan, Shangri-La (Zhongdian County), 3000 m, 05.07.1937, *Yu T. T.*, 11920 (Holotype: KUN!; Isotype: AMES! [AMES00104951], PE! [PE01432254]).

Description. Plant 4–16 cm tall. Tubers globose, 4–15 × 4–10 mm. Stem with 2 or 3 tubular sheaths and 1–2 leaves at base. Leaves subopposite or opposite, oblong, elliptic, or spatulate, 2–7 × 0.3–2 cm, apex obtuse or acute. Inflorescence 3–14 cm; peduncle cylindrical, ebracteate; rachis 1–5 cm, laxly flowered; floral bracts ovate, shorter than ovary, apex obtuse. Flowers pale green; 5 mm across, pedicel and ovary twisted and hooked, 3–6 mm. Dorsal sepal broadly ovate, concave, 3–4 × 2–2.5 mm, apex obtuse; lateral sepals obliquely lanceolate, 3–4 × 1–1.4 mm, apex obtuse. Petals elliptic to lanceolate, falcate, 3–4 × 1.3–1.8 mm, upper half-fleshy, apex obtuse. Lip pandurate, 5.5 × 2.5 mm, concave with spur like saccate base, 3-lobed above middle; lateral lobes triangular, 0.5 × 0.8 mm, apex obtuse; midlobe triangular, 1 × 0.6 mm, apex obtuse. Column 0.7 mm; pollinia globose; caudicles nearly obsolete, viscidia involute, horn-like, rostellum triangular, armed, stigma transversely oblong, situated below the rostellum. Fruit oblong, 6–7 mm long.

Flowering time. July–August.

Habitat. Terrestrial in alpine grasslands and meadows at elevations of 2500–4100 m.

Distribution. China, Nepal.

Type. INDIA. Himachal Pradesh, Simla, Banatar, 08.1834, *Edgeworth s.n.* (Holotype: K! [K000247384]).

Description. Plant 20–50 cm tall. Tuber subglobose to ellipsoid, 1–2.4 × 0.4–9 cm. Stem with tubular sheaths at base, 3–5-leaved. Leaves well-spaced, broadly ovate to ovate-oblong, lanceolate, 4–8 × 1–4 cm, apex acute. Inflorescence 20–30 cm, peduncle cylindrical with foliaceous lanceolate bracts, apex acute, 1–3 × 2–4 cm, rachis 7–28 cm long with densely many flowers; floral bracts lanceolate, acute, equal or shorter than ovary, 5–15 × 2–3 mm. Flowers pale yellowish green to greenish yellow, ca. 1 cm long, pedicel and ovary arcuate, beaked, twisted, 5–15 cm long. Dorsal sepal broadly elliptic-ovate, concave, margin ciliated, 3–4 × 4–5 mm, lateral sepals reflexed, oblong ovate, margin ciliated, apex obtuse, 4.5–6 × 2–3 mm. Petals obliquely ovate-lanceolate, apex acute, 4–6 × 1.5–2 mm. Lip entire, lingulate, 7 × 2 mm with concave at base, slightly fleshy, clawed above base, apex obtuse, spur cylindrical, spreading upwards, longer than the ovary, 1–2 cm long. Column 4 mm long, pollinia subglobose, with short caudicle, viscidia orbicular; rostellum triangular, ca. 2 mm; stigma lobes separate, clavate to oblong, ca. 2 mm, spreading on either side of lip base.

Flowering time. August–September.

Habitat. Terrestrial in *Quercus* forest and forest margins, and in subalpine grassland at elevations of 1800–2500 m.

Distribution. China, India, Myanmar, Nepal.

Specimens examined. CHINA: **Tibet**, Yatung, 1897, *Hobson H. E., s.n.* (K); Jatung, 3050 m, 03.08.1936, *Spencer Chapman F., 334* (K); Lhasa, 1947, *Guthrie J., s.n.* (K).

Description. Plant 10–40 cm tall. Tubers oblong-ellipsoid, 1–2.5 × 0.5–1 cm. Stem with 1 or 2 tubular sheaths at base, 2–3-leaved. Leaves cauline, elliptic to lanceolate, 3–12 × 0.8–2 cm, apex acute or acuminate. Inflorescence 6–32 cm; peduncle cylindrical, slender; peduncle-scales 1 or 2, lanceolate, to 3 cm; rachis 3–22 cm, rather laxly to subdensely many-flowered; floral bracts lanceolate, 4–8 mm, nearly equal to or shorter than ovary, apex acuminate. Flowers subsecund, yellowish green; pedicel and ovary arcuate, shortly beaked, 6–9 mm. Dorsal sepal broadly ovate, concave, 1.5–2 × 1.5–2 mm, apex obtuse; lateral sepals oblique, ovate, 1.5–2.3 × 1–1.5 mm, apex acute. Petals hooded with dorsal sepals, ovate, oblique, upper half fleshy, 2–3 × 1–1.5 mm, apex obtuse. Lip oblong, 2–3 × 1–1.5 mm, base concave, 3-lobed near middle; lateral lobes oblong, 1 × 0.5 mm, apex obtuse; mid-lobe oblong, 1.5 × 1.3 mm, apex obtuse; spur pendulous, oblong-clavate, 1 mm, apex obtuse. Column 1 mm; pollinia ellipsoid, viscidia involute, rostellum triangular, stigma transversely oblong situated below the rostellum. Fruit oblong, 0.5–1 cm long.

Flowering time. July–September.

Habitat. Terrestrial in coniferous and broad-leaved mixed forests and on alpine grassy slopes at elevations of 2100–4100 m, once reported growing on oak trees.

Distribution. Bhutan, China, India, Myanmar, Nepal.

Specimens examined. BHUTAN: Gasa Dist., Upper Mo Chu, around Taktsimaghang, 3560–3600 m, 14.08.2000, *Miehe G. and Miehe S.*, 00-286-03 (K); Gasa Dist., Upper Mo Chu, 3900 m, 12.08.2000, *Miehe G. and Miehe S.*, 00-278-04 (K).

15. *Herminium fimbriatum* (Raskoti) X.H. Jin, Schuit., Raskoti & L.Q. Huang, *Cladistics* 2015.

Basionym. *Bhutanthera fimbriata* Raskoti, *Phytotaxa* 62: 57–60. 2012

Type. NEPAL. Rasuwa, 3800 m, 14 July 2008, *Raskoti B. B.*, 234 (Holotype: KATH!).

Description. Plant 11 cm tall. Tubers subglobose, 5 mm in diameter. Stem with an ovate, tubular sheath and 2 leaves at base. Leaves opposite, elliptic-ovate, 3.0–3.5 × 2.0–2.2 cm, apex obtuse. Inflorescence densely up to 8-flowered; peduncle 7 cm long, rachis 2.5 cm long, lower floral bracts ovate-triangular, 1 × 1 mm, apex acute, upper bracts lanceolate, 2 × 1 mm, apex acuminate. Flowers 1 cm across, sepals green with white margins, petals and lip white; pedicel and ovary fusiform, ridged, 7 mm long, apex beaked. Dorsal sepal broadly ovate, 4.0–5.0 × 2.5 mm, margin of the apical portion weakly fimbriate, apex obtuse; lateral sepals elliptic-ovate, oblique, 5.0–6.0 × 2.0–2.5 mm, margin of the apical portion weakly fimbriate, apex obtuse. Petals orbicular-elliptic, concave, 2.5 × 2.5 mm, apex rotund. Lip oblong, 4.0 × 1.5 mm, fleshy, trilobed below the middle; side lobes oblong-lanceolate, 2.0 × 0.5 mm, apex acute; midlobe oblong, 2.5 × 1.0 mm, apex obtuse; spur cylindrical with slightly dilated apex, 3.0–4.0 mm long, apex obtuse. Column 1 mm long, pollinia clavate-elliptic. Fruit oblong.

Flowering time. July

Habitat. Terrestrial in subalpine meadows and open moist places at elevation of 3800 m.

Distribution. Endemic to Nepal.

Description. Plant 12–40 cm tall. Tubers ovoid-oblongoid, 1–4 cm long. Stem slender, with 2 or 3 tubular sheaths and (2–)3–4(–5) widely spaced leaves. Leaves oblong-lanceolate, 4–10 × 0.5–2.3 cm, apex acute. Inflorescence 10–30 cm; peduncle cylindrical, peduncle-scales several, often foliaceous, lanceolate, rachis 3–20 cm, densely many flowered; floral bracts ovate-lanceolate, 5–20 mm, longer than ovary, apex acuminate. Flowers green; pedicel and ovary arcuate, shortly beaked, 4–10 mm. Dorsal sepal oblong-ovate, 2–3.5 × 1.5–3 mm, apex obtuse; lateral sepals oblong-lanceolate, slightly oblique, 2–3.5 × 1–1.5 mm, apex obtuse. Petals ovate-lanceolate, oblique, 2–4 × 1–1.6 mm, apex obtuse. Lip lingulate, entire, 3–5 × 1–1.5 mm, ecallose, margin incurved, apex obtuse; spur pendulous, 0.8–1 mm, much shorter than ovary, apex obtuse. Column 1.5 mm; pollinia clavate, viscidium involute, horn-like; rostellum triangular with short arms, stigma transversely oblong situated below the rostellum.

Flowering time. June–August.

Habitat. Terrestrial in *Quercus-Abies* forests along valleys, and on grassy slopes at elevations of 1200–4000 m.

Distribution. China (Gansu, Guizhou, Hubei, Sichuan, Xizang, Yunnan).

Specimens examined. CHINA: **Guizhou**, Guiyang, 1300 m, 03.05.2000, *Luo Y.B.*, 291 (PE); **Sichuan**, Danba county, 3000 m, 6.8.1940, *Qu G. Herminium esquirolii X. H. Jin, Schuit., Raskoti & L. Q. Huang, Cladistics 2015, **syn. nov.**
Not *Herminium ophioglossoides* Schltr.

Type. INDIA. Sikkim, Lachen valley, 07.1895, *Pantling R.*, 397 (Lectotype: CAL! [CAL 0000000673]; Isolectotype: K! [K000880291], Isotype: P! [P00378583]).

Description. Plant 15 cm tall. Tuber globose, 4–6 × 3–5 mm. Stem with 1 or 2 tubular sheaths and 1 leaf at base. Leaf shortly petiolate and sheathing, (narrowly) ovate-elliptic to oblong-spathulate, 0.7–65 × 0.4–1.0 cm, apex obtuse. Inflorescence 7–10 cm, ebracteate, rachis 0.7–4 cm long, rather laxly 3–20-flowered, floral bracts

Figure 12. *Herminium gracile*. **A** Flowering plant **B** Flower (front view) **C** Flower (side view) **D** Ovary with column and lip **E** Dorsal, lateral sepals, petals (spread) **F** Section of the ovary **G** Floral bract.

scale-like, ca. 1 mm long, apex subtruncate to almost 3-dentate. Flowers yellowish green or green, 1.5–2 mm across, pedicel and ovary fusiform, slightly beaked, 2–4.5 mm long. Dorsal sepal hooded with petals, broadly oblong-ovate, 1–1.7 × 0.4–1.5 mm, concave, apex obtuse; lateral sepals deflexed, parallel to lip, obliquely elliptic-oblong, 2–2.8 × 1–1.5 mm, apex obtuse. Petals oblong-elliptic to obliquely ovate, 1.0–2.3 × 1.0–1.3 mm, apex obtuse. Lip entire, oblong-lingulate, rather abruptly dilated at base, 1.0–2.6 × 0.3–0.5 mm, with two basal concavities separated by a longitudinal callus ridge, apex obtuse to subacute. Column ca. 1 mm tall; rostellum broadly triangular, anther locules divergent, with somewhat elongate, incurved anther-channels; pollinia ovoid, with short but distinct caudicles, viscidium globose, staminodes oblong, stigmas 2, pulvinate, attached to base of rostellum. Fruit fusiform, ca. 5 mm long.

Flowering time. July–August.

Habitat. Terrestrial on shady, moss-covered slopes and in alpine grassland, at elevations of 3300–4200 m.

Distribution. Bhutan, China, India.

Note. When describing *Herminium gracile*, King & Pantling erroneously interpreted the base of the lip with its two concavities as being part of the column, hence they and later authors believed that this species lacked the basal concavities of the lip that are seen in *H. pugioniforme*. In fact, the two taxa are quite similar in lip morphology, but differ in that *H. gracile* has well-developed caudicles (rudimentary in *H. pugioniforme*), distinct, elongated anther-channels (rudimentary anther channels), and deflexed lateral sepals that are held parallel with the lip (patent lateral sepals). In addition, *H. gracile* usually has a much more slender inflorescence with more widely spaced flowers. We find no significant differences in the protologue of *Androcorys ophioglossoides*; the fact that Schlechter stressed the uniqueness of this species makes us suspect that he did not compare it with *Herminium gracile*.

Specimens examined. CHINA: **Qinghai**, Maqin county, Dawu town 3980 m, 23.07.1993, *Ho T. N. et al.* 801 (PE); **Shaanxi**, Mei county, 3400 m, 30.06.1999, *Zhu C. & Xu W.*, 1354 (PE).

Description. Plant 5–6.5 cm tall. Tuber ovoid to globose, 0.7–0.9 × 0.4–1 cm. Stem with 2 leaves and tubular sheaths. Leaves subopposite, sheathed, lanceolate-elliptic, obtuse to subacute, 1.7–2.2 × 0.4–0.9 cm. Inflorescence subsecund, laxly 3–4-flowered; rachis glabrous, 1–2 cm long; floral bracts triangular-lanceolate, acute, 0.5–0.6 × 0.6–0.8 mm. Flowers 0.7–0.9 cm across; white, dorsal sepal with a green central nerve; pedicel and ovary twisted, 5–6 mm long. Dorsal sepal ovate-elliptic, subacute, 4–5 × 3 mm; lateral sepals ovate-lanceolate, obtuse to subacute, 6 × 2.8–3 mm. Petals

Figure 13. *Herminium himalayanum*. **A** Flowering plant **B** Flower (front view) **C** Flower (side view) **D** Dorsal sepal, petal and lateral sepal **E** Lip **F** Section of ovary with column and lip **G** Floral bracts **H** Column (front view) **I** Column (side view).

spathulate, obtuse, cucullate at apex, $2\text{--}2.5 \times 1.5\text{--}2$ mm. Lip 3-lobed, spurred at base; lateral lobes linear, acute, $2\text{--}2.5 \times 0.5\text{--}0.6$ mm; mid-lobe linear to lingulate, obtuse, $3.5\text{--}4 \times 0.5\text{--}0.8$ mm; spur cylindrical-conical, obtuse, 1.5–2 mm long. Column 1.5–2 mm long; rostellum 0.25 mm long; pollinia 1.2 mm long.

Flowering time. July–August.

Habitat. Terrestrial on alpine grassy slopes at elevations of 3960–4570 m.

Distribution. Bhutan, China.

Specimens examined. BHUTAN: Thimphu district, Barshong (Parshong), 27.07.1914, *Cooper*, 1979 (E); Pumo La, 08.1938, *Gould* 1294 (K); Upper Pho Chu

district, Kesha La (Chesha La), 27.07.1949, *Ludlow, Sherriff and Hicks*, 16640 (BM); Upper Bumthang Chu district, Marlung, 12.07.1949, *Ludlow, Sherriff and Hicks*, 19413 (BM, E); Upper Kulong Chu district, Shingbe, 24.06.1949, *Ludlow, Sherriff and Hicks*, 20401 (BM).

CHINA: **Tibet**, Yadong county, 4000 m, 01.08.2012, *Jin X.H., Jin W.T. & Xu S.*, 13211 (PE).

Note. *Herminium himalayana* is closely related to *H. albomarginatum* but differs in having larger flowers (more than 5 mm across) and white sepals, and less than five flowers in an inflorescence.

21. *Herminium hongdeyuanii* Raskoti, *Phytotaxa*, 98 (1): 23–26. 2013.

Type. NEPAL. Chandragiri, 2200 m, 25.09.2012, *Raskoti B. B.*, 571 (Holotype: KATH!).

Description. Plant 35–42 cm tall. Tubers subglobose, 10 × 5 mm. Stem with 2 tubular sheaths at base, upper part with 3 leaves. Leaves cauline, alternate, linear, 15–21 × 0.5–1.0 cm, apex acuminate, base sheathing. Inflorescence 20 cm; peduncle 4–6 cm, ridged, without peduncle-scales; rachis 13–15 cm, with several secund flowers; floral bracts lanceolate, 5–10 × 1–2 mm, 1-veined, exceeding or shorter than the ovary, apex acuminate. Flowers yellowish green, 2–3 mm across, secund, ovary fusiform, slightly arcuate, 5–9 mm long, ridged, apex slightly beaked; dorsal sepal suberect, ovate, 2 × 1 mm, apex sub-obtuse; lateral sepals spreading, ovate, oblique, 2.5 × 1.0 mm, apex sub-obtuse; petals forming a hood with dorsal sepal, oblong, 2.0–4.0 × 1.0 mm, apex obtuse, lip oblong, held horizontally, slightly curved, 1.0–3.0 × 0.5–1.0 mm, base dilated shallowly concave, contracted in the middle, with three ridges running from base to the midlobe, trilobed near apex; lateral lobes falcately triangular, 0.5 × 0.5 mm, apex sub-obtuse; midlobe triangular, 0.7 × 0.4 mm, apex sub-obtuse. Column ca. 1 mm; auricle ca. 0.5 mm, pollinia 0.5 mm, globose; viscidia ovoid, stigma transverse, ca. 1 mm, extending outwards from the rostellum.

Flowering time. September.

Distribution. Endemic to Nepal.

Specimen examined. NEPAL. Chandragiri, 2200 m, 25.09.2012, *Raskoti B. B.*, 571 (KATH).

Habitat. Terrestrial on humus-rich grassy slopes at an elevation of 2200 m.

Note. This species is close to *Herminium lanceum* but differs in having smaller flowers and a ridged peduncle; the midlobe of the lip is longer than the lateral lobes, the lateral lobes are triangular and always wider than the midlobe.

22. *Herminium humidicola* (K.Y. Lang & D.S. Deng) X.H. Jin, Schuit., Raskoti & L.Q. Huang, *Cladistics* 2015.

Frigidorchis humidicola (K. Y. Lang & D. S. Deng) Z. J. Liu & S. C. Chen, *J. Fairylake Bot. Gard.* 6 (3): 17. 2007.

Bhutanthera humidicola (K.Y. Lang & D.S. Deng) Ormerod, *Taiwania* 48: 139. 2003.

Basionym. *Peristylus humidicola* K. Y. Lang & D. S. Deng, *Novon* 6: 190. 1996 ('*humidicolus*').

Type. CHINA. Qinghai, Magen county, Dawu Xiang, Muchang, SE of Magen, 3980 m, 05.08.1993, *Ho et al.*, 807 (Holotype: HNWP; Isotype: GH! [GH00243080], PE!).

Description. Plant 3–4.5 cm tall. Tuber globose 10–12 × 5–8 mm. Stem sheathed at base, 2–3 leaved. Leaves crowded, ovate-elliptic to ovate-lanceolate, 2.5–3 × 1–1.5 cm, apex acute; petioles enclosed by 2 tubular sheaths forming a pseudostem 8–12 mm. Inflorescence 1.5–2 cm, equal or exceeding leaves, subcorymbose, densely 4–5-flowered. Flowers greenish-yellow; sepals white-margined apically; petals and lip becoming deep purple after pollination; pedicel and ovary 11–15 mm. Dorsal sepal suborbicular, 3–4.5 × 2.5 mm, margin denticulate toward apex; lateral sepals ovate-elliptic, 4 × 3 mm, slightly longer than dorsal sepal. Petals orbicular, 2–3 × ca. 1.5 mm, fleshy, apex obtuse. Lip 3–4 mm, fleshy, spurred, 3-lobed toward its base; lateral lobes triangular, ca. 0.5 mm; mid-lobe lingulate-linear, 2–3 × ca. 0.7 mm; spur 1–2 mm long, rounded-obtuse. Column 1.5 mm, pollinia obovoid, caudicles short, viscidium disc like, rostellum triangular, shortly armed; stigmas clavate, situated below the rostellum. Fruit oblong, 6–10 mm long.

Flowering time. August.

Habitat. Terrestrial in alpine meadows and wet valleys at elevations of 3600–4500 m.

Distribution. Endemic to China (Gansu, Qinghai, Tibet).

Specimen examined. CHINA: **Qinghai**, Gande county, Along Road S101 from Gande to Maqin, 4172 m, 08.08.2014 *Jin X. H., Jin W.T. and Cui Y.*, 1451 (PE).

23. *Herminium jaffreyanum* King & Pantl., *J. Asiat. Soc. Bengal*, Pt. 2, Nat. Hist. 65: 130. 1896.

Monorchis jaffreyana (King & Pantl.) O. Schwarz. *Mitt. Thuring. Bot. Ges.* 1:95.1949.

Type. INDIA. Sikkim, near the top of Sinchal, 8600 ft, *Pantling R.*, 237 (Holotype: CAL; Isotypes: GH! [GH00100255], K! [K000079029, K000079030]).

Description. Plant 8–20 cm tall. Tuber oblong to ellipsoidal, 10–20 × 10–15 mm. Stem 6–12 cm, with tubular sheaths at base and 2 alternate leaves near middle. Leaves oblong, 10–22 × 0.7–1 cm, apex acute. Inflorescence 6–12 cm; peduncle cylindrical, with or without a peduncle scale; rachis 10–14 cm, densely many-flowered; floral bracts ovate-lanceolate, 3–7 mm, nearly equal to ovary, apex acuminate. Flowers pale green; pedicel and ovary arcuate, 3–7 mm, apex beaked. Flower 4 mm across, greenish. Dorsal sepal broadly ovate-elliptic, concave, 2–3 × 0.5–1 mm, apex obtuse, lateral sepals ovate-lanceolate, slightly oblique, 2–3 × 0.5–1 mm apex obtuse. Petals spreading, oblong, 1.5–3 × ca. 0.2–0.5 mm, apex obtuse, lip oblong, base concave and dilated, 3-lobed above middle, lateral lobes reduced, ovate; mid-lobe triangular, apex obtuse. Column 7 mm, broad, anther discrete, parallel, pollinia obovoid, caudicles very short, viscidium globose, stigma transversely oblong situated below the rostellum.

Flowering. July–August.

Habitat. Terrestrial or epiphytic in humid area at elevations of 2500–3300 m.

Distribution. India, Nepal.

Specimens examined. INDIA. **Sikkim**, Singalila, 3048 m, 08.1892, *Pantling R.*, 237 (K); Sikkim, 2134 m, *Hooker J.D.*, 279 (K-LINDL); Singalila, 3050 m, 08.1896, *Pantling R.*, 237 (E); Darjeeling, “Rungbool” (?), 2150 m, 8.1878, *Gamble J. S.*, 3967A (K).

NEPAL: **Koshi**, Terhthum district, Tute Deurali, 2500 m, 29.08.2007, *Raskoti B.B.*, 020139 (KATH).

Note. There are several specimens in various herbaria labelled as *Pantling 237*, but these are all from localities and elevations not corresponding to the locality and elevation cited in the protologue. Therefore, these are not isotype specimens.

24. *Herminium josephi* Rchb.f., *Flora* 55: 276. 1872.

Monorchis forrestii (Schltr.) O. Schwarz, Mitt. Thüring. Bot. Ges. 1: 95.1949.

Type. INDIA. Sikkim, *Hooker*, 264 (Holotype: K-LINDL! [K000079043]; Isotypes: K! [K000881604], GH! [GH00100256], P! [P00378620]).

Description. Plant 5–26 cm tall. Tubers ovoid, 10–15 × 5–10 mm. Stem with 2 or 3 tubular sheaths and 2 leaves at base. Leaves opposite or subopposite, oblong-elliptic, spathulate or lanceolate, 2.5–10 × 0.5–2 cm, apex acute. Inflorescence 6–20 cm; peduncle cylindrical, ebracteate; rachis 1.5–5 cm, subdensely many-flowered; floral bracts ovate-triangular, 2–3 mm, much shorter than pedicel and ovary, apex acute. Flowers green to yellowish green; pedicel and ovary twisted, 4–6 mm, apex strongly beaked. Dorsal sepal broadly ovate, 2.5–3.5 × 1.5–2 mm, apex obtuse; lateral sepals lanceolate, oblique, 3–4.5 × 1–1.5 mm, apex obtuse. Petals ovate-lanceolate, falcate, 3–3.5 × 1–1.5 mm, apex acute. Lip entire, ovate, (3–)4–5 × (2–)3–4 mm, disk with 2 closely spaced, parallel, longitudinal keels in basal half, apex acute. Column 1–1.5 mm; pollinia obovoid; caudicles short, viscidia involute, hornlike, rostellum triangular, stigma transversely oblong, situated below the rostellum.

Flowering time. July–September.

Habitat. Terrestrial in *Quercus-Abies* forests, forest margins, and alpine meadows at elevations of 1200–4550 m.

Distribution. Bhutan, China, India, Nepal.

Selected specimens examined. BHUTAN: Phoji Ding, 3720 m, 03.08.1971, *Ramesh Bedi*, 618 (K); Gasa Dist., W of Thanza, 4140 m, 04.09.2000, *Miehe G. & Miehe S.*, 00-350-30 (K).

K. and Subedhi N. N.*, 8014 (KATH).

Note. While the type material of *H. duthiei* is referable to *H. josephi*, albeit a small-flowered form, most specimens in herbaria labelled as *H. duthiei* are in fact *H. macrophyllum*. It is possible that some degree of hybridization occurs between the two species.

25. *Herminium kalimpongense* Pradhan, Indian Orchids: Guide Identif. & Cult. 1: 52–53. 1976.

Androcorys kalimpongensis (Pradhan) Agrawala & H.J. Chowdhery, Kew Bull. 65: 106. 2010.

Type. INDIA. West Bengal, Kalimpong, 16.06.1974, *Pradhan U.C.*, (Holotype: Herbarium Pradhan, not located).

Description. Plant 12–15 cm tall. Tuber 1–1.5 × 1 cm, globose to ovoid globose. Stem 0.8–1 cm long with 1, sessile, radical leaf. Leaf cordate, 2–2.5 cm, somewhat fleshy. Scape slender, 12–15 cm with tubular, acute, peduncle-scales, rachis with 3–4 well-spaced flowers, floral bracts 1 cm, apex acuminate. Flower half-opening, sepals subequal. Dorsal sepal 6 × 2 mm, concave, apex obtuse; lateral sepals 6 × 1 mm, apex acute. Petals 6 × 1 mm, hooded with dorsal sepal, apex acute. Lip 7 × 1.5 mm, entire, base broader than apex, spurless. Column well-developed, anther broad, pollinia ovate-globose with small viscidia, stigma transversely oblong.

Flowering. August.

Habitat. Not known. Collected at an elevation of 2000 m.

Distribution. India.

Note. Our description is based on the protologue in Pradhan (1976). Although the cordate leaf of this species as described is different from that of all other species of *Herminium*, the floral characters suggest that it belongs in this genus. However, further study is required to determine its taxonomic position.

26. *Herminium kamengense* A.N. Rao, J. Econ. Tax. Bot. 25(2): 287. 2001.

Figs 9P, 10E

Type. Yarlung Zangbo–Brahmaputra Region. Kameng district, Bomdila, 2500 m, *Rao A.N.*, 30600A (Holotype: TIPI!).

Description. Plant 15–35 cm tall. Tubers ca. 1.5 × 0.5 cm. Stem up to 18 cm tall, slender, with about 2 tubular sheaths in the lower half, 2–3-leaved. Leaves linear-oblong or narrowly lanceolate, acuminate, 27 × 1.5 cm, sheathing at base. Inflorescence 24 cm long; rachis about 6–12 cm long, many flowered. Flowers about 7 mm long, green, floral bracts 6–10 × 1.5–2 mm, ovate-lanceolate, acuminate, longer than ovary, pedicel and ovary 6–9 mm long. Dorsal sepal ovate, obtuse, 1.5–2.5 × 1–1.5 mm; lateral sepals obliquely ovate, 2–3 × 1.4–2 mm, apex obtuse. Petals 2–3 × 0.7–1 mm, subfalcate, oblong-lanceolate, apex subacute. Lip broadly ovate, with a circular concavity at base; 4 × 3 mm, base dilated, 3-lobed above middle, lateral lobes oblong, 1.5 × 0.5 mm, midlobe 0.5 × 0.5 mm long, triangular; lateral lobes 1.5 mm long, narrowly oblong, divergent, projected forwards. Column about 1 mm long, with 2 staminodes. Pollinia sectile, obovoid, with minute viscidia, rostellum triangular, stigma transversely oblong situated below the rostellum. Fruit oblong, 6–10 mm long.

Flowering. August–September.

Habitat. Terrestrial in *Quercus* forest on moist slopes at elevations of 2200–2500 m.

Distribution. China, India, Nepal.

Specimens examined. Yarlung Zangbo–Brahmaputra Region: Kameng district, Bomdila (2500 m), *Rao A.N.*, 30600AB (CAL). NEPAL: **Koshi**, Dhankutta District, between Sidhuwa and Chitrye, 2200 m, 19.08.2012, *Raskoti B. B.*, 00357 (KATH).

27. *Herminium kumaunense* Deva & Naithani, Orchid Fl. N.W. Himalaya: 159. 1986 ('*kumaunensis*').

Type. INDIA. Lohit district, Jachup, *Haridasan K.*, 3670 (Holotype: A.P. Forest Herbarium).

Description. Plant upto 12 cm tall. Tubers 2, ovoid, ca. 1.0 × 0.5 cm. Leaves 2, basal, unequal, about 6 × 0.7 cm apex acute. Inflorescence 5 cm long, with lax flowered. Flowers small, green, ovary beaked and strongly hooked; floral bract lanceolate, apex acute, slightly shorter than the ovary. Dorsal sepal ovate-lanceolate, acute, ca. 2.5 mm long; lateral sepal obliquely lanceolate, apex acute. Petals oblong, acute, ca. 2 mm long, slightly contracted at the middle. Lip subequal to sepals, broadly saccate in the lower half, obscurely 3-lobed in the upper half; lateral lobes ovate, acute, shorter than the middle; mid-lobe oblong, obtuse. Column short, pollinia ranal shaped, rostellum triangular.

Flowering time. August.

Habitat. Terrestrial on grassy slopes at an elevation of 3000 m.

Distribution. India.

Notes. The description of this species is based on the protologue. Most of the characters are similar to *Herminium pygmaeum* except for the petals being constricted in the middle. More specimens and further study are necessary to determine its taxonomic status.

Type. INDONESIA. **JAVA**, *Thunberg C. P.*, 21289 (Holotype: UPS!).

Description. Plant 10–66 cm tall. Tubers ovoid, globose or ellipsoid, 10–15 × 5–20 mm. Stem with two tubular sheaths at base and 2–5 leaves. Leaves alternate, linear-lanceolate, 0.5–2.5 × 0.4–1.5 cm, apex acuminate. Inflorescence 5–40 cm; peduncle cylindrical, with linear-lanceolate peduncle-scales 1–7 cm; rachis 5–35 cm, laxly many flowered; floral bracts lanceolate, 3–12 mm, equal or longer than ovary, apex acuminate. Flowers pale yellowish green, pedicel and ovary 4–10 mm, slightly beaked at apex. Dorsal sepal broadly ovate, concave, 2.2–4 × 1–1.5 mm, apex obtuse; lateral sepals ovate, oblique, 2–4 × 1–2 mm, apex acute. Petals connivent with dorsal sepals, linear, 2–4 × 0.5–1 mm, apex acute. Lip oblong, 4–8 × 1–2 mm, base dilated, 3-lobed near middle, lateral lobes linear, 3 × 0.3 mm; mid-lobe oblong, 1 × 0.3 mm, apex obtuse. Column 1.4 mm; pollinia globose; caudicles short, viscidia orbicular, rostellum triangular, stigma transversely oblong, situated below the rostellum. Capsule oblong, 1 cm long.

Flowering time. June–October.

Habitat. Terrestrial in pine forests and on grassy slopes at elevations of 700–3743 m (–4700 m: type of *H. altigenum*), occasionally epiphytic on trunks of *Quercus* sp.

Distribution. Bhutan, China, East Timor, India, Indonesia, Japan, South Korea, Malaysia, Myanmar, Nepal, Pakistan, Papua New Guinea, Philippines, Thailand, Vietnam.

Type. INDIA. North, Wallich N (*leg. Blinkworth*), 7040 p.p. (Holotype: K-LINDL, Isotype: K! [K000974253]).

Description. Plant 15–68 cm tall. Tuber ellipsoid, 1–2.5 cm. Stem with 2 or 3 tubular sheaths at base and 3–4 leaves. Leaves spirally arranged, well-spaced, ovate, 5–12 × 2–5 cm, apex acuminate. Inflorescence 11–28 cm, peduncle cylindrical with 1–4 peduncle scales; rachis 4–30 cm, laxly many flowered; floral bracts lanceolate, apex acuminate, equal or longer than ovary, 1–2 cm. Flowers yellowish green; ovary and pedicel cylindrical-fusiform, arcuate, and beaked, 1–1.5 mm. Dorsal sepal connivent with petals, broadly ovate, cymbiform, 4–7 × 3–5 mm, margin ciliate, apex obtuse; lateral sepals reflexed, oblong-ovate, oblique, 5–8 × 3–4 mm, margin ciliate, apex obtuse. Petals oblong, oblique, 4–7 × 3–5 mm, apex subacute. Lip oblong-lingulate, 6–13 × 1–1.5 mm, entire, apex obtuse; disk with a conic callus in front of mouth of spur; spur cylindrical, 8–18 mm, longer than ovary. Column 0.5 mm; staminodes subsquare; anther locules nearly parallel; pollinia obovoid, with very short caudicles and orbicular

30. *Herminium longilobatum* S.N. Hegde & A.N. Rao, Himalayan Pl. J. 1(2): 47. 1982.

Fig. 10F

Type. Yarlung Zangbo–Brahmaputra Region, Towang, 2800 m, *Hegde*, 3208-A (Holotype: TIPI!).

Description. Plant 30–50 cm tall. Tubers ovoid, globose to oblong. Stem with 2 tubular sheaths at base and few well-spaced leaves near middle. Leaves 8–20 × 0.5–1.5 cm, linear to oblong, acuminate. Inflorescence 8–30 cm; peduncle cylindrical, with peduncle-scales 0.5–2.4 cm; rachis 5–18 cm, densely many flowered; floral bracts ovate-lanceolate, 1.5–5 mm, shorter than ovary, apex acuminate. Flowers pale green; ca. 4 mm across, pedicel and ovary arcuate, 4–7 mm, shortly beaked. Dorsal sepals 2.0 × 1.5 mm, concave, ovate, apex subacute. Petals lanceolate, 2.0 × 1.5 mm, apex subacute. Lip oblong, 3-lobed, with a callus at base, midlobe very short, lanceolate, obtuse; lateral lobes 10 mm long, more than 10 times longer than the midlobe, filiform, coiled. Column 1 mm, short; anther cells 2, parallel; staminodes 2, lateral; rostellum 2-lobed; stigmas 2, transversely oblong, divergent. Fruit oblong, 7 mm long.

Flowering: August–September.

Habitat. Terrestrial in oak forest at elevations of 2500–2800 m.

Distribution. China, India, Nepal.

Specimen examined. Yarlung Zangbo–Brahmaputra Region: **Kameng** district, Towang, *Hegde*, 3208 A-C (Orchid Herbarium, Tipi); Phudong-Dirang, Hajra 54808 (ASSAM). NEPAL: **Sagarmatha**, Solukhumbu district, below Sete, 2500 m, *Raskoti B. B.*, 01299 (KATH).

Note. *Herminium longilobatum* is similar to *Herminium lanceum* but the lateral lobes of lip are much longer (10 vs. 3 mm) and the lip often has a callus at the base.

31. *Herminium mackinnonii* Duthie, Journ. As. Soc. Beng. Nat. His. 71: 44. 1902.

Monorchis mackinnonii (Duthie) O. Schwarz, Mitt. Thüring. Bot. Ges. 1: 95. 1949.

Type. INDIA. Lehari-Garhwal, near Mussoorie, 6000 ft, 30.08.1901, *Mackinnon P. W.*, 25421 (Holotype: K! [K000079024]; Isotype: AMES! [AMES00100258]).

Description. Plant 15–30 cm tall. Tuber oblong, 7–1.5 × 5–12 mm. Stem with tubular sheaths and 2 basal, subopposite leaves. Leaves linear-lanceolate, 10–16 × 1–1.5 cm, acute to acuminate. Inflorescence 10–20 cm, cylindrical, with or without peduncle-scales, rachis 10–15 cm, subdensely many-flowered, floral bracts 5 mm, broadly lanceolate, acuminate, shorter than the ovary. Flowers subsecund, spreading, 5–10 mm across, ovary straight, slightly beaked at 6 mm. Dorsal sepals ovate-oblong, 2.5–3.5 × 1.5–2 mm, obtuse; lateral sepals obliquely ovate-oblong, 2–3 × 1.5–2 mm, acute. Petals linear-lanceolate, 3 × 1 mm, apex acute. Lip deflexed, 3-lobed above middle, basal part concave, dilated and with a small concavity at the base, lateral lobes linear, apex acute, midlobe lanceolate, apex obtuse. Column 1 mm, anther cells parallel, pollinia ovate ellipsoid, caudicles very short, viscidium discoid, rostellum triangular armed, stigma 2, transversely oblong, lying beneath the rostellum.

Flowering time. July–August.

Habitat. Terrestrial or epiphytic on trunk or large branches of oak trees at elevations of 2400–2700 m.

Distribution. India, Nepal.

Specimens examined. NEPAL: **Koshi**, Bhuje Danda to Tamur River, 2700 m, 03.08.1989, *Grey-Wilson et al.*, 135 (KATH); **Mechi**, Ilam District, Hille-Chintapu, 2450 m, 07.10.1977, *Pradhan P., Rajbhandari K. R. and Niraula R.*, 289 (KATH).

Peristylus duthiei var. *inayatii* Deva & H.B. Naithani, Orchid Fl. N.W. Himalaya 185. 1986, *syn. nov.* Type: INDIA. Uttarakhand, Pithoragarh District, Kumaon, Ralam Valley; 19.8.1900; *Inayat 24103* (Holotype: DD).

Basionym. *Neottia macrophylla* D. Don, Prodr. Fl. Nepal. 27. 1825

Type. NEPAL. 1819, *Wallich N. s.n.* (Holotype: BM! [BM000034355]).

Description. Plant 8–25 cm tall. Tubers ovoid, 6–15 × 5–10 mm. Stem with 2 or 3 tubular sheaths and 2–3 leaves at base. Leaves oblong-elliptic or oblanceolate, 3–10 × 0.6–2 cm, apex subacute to obtuse. Inflorescence 6–15 cm; peduncle cylindrical, without or rarely with 1 foliaceous peduncle-scale; rachis 2–9 cm, subdensely flowered; floral bracts ovate-triangular, 1–3 mm, shorter than ovary, apex acute. Flowers white or green, or green with white tips; pedicel and ovary twisted, hooked at apex, 3–6 mm. Dorsal sepal ovate, 0.5–2 × 0.8–1.2 mm, apex obtuse; lateral sepals oblong, 1.5–2 × 0.5–1 mm, apex acute. Petals obliquely ovate-triangular, fleshy, 1.5–2 × 0.7–1.2 mm, apex acute. Lip ovate-lanceolate, 1.6–3 × 0.6–1 mm, with spur like globose saccate base, dilated, disk at base concave, with a single raised crest, indistinctly 3-lobed at base; lateral lobes obscure, margin crenulate, mid-lobe ovate-triangular, 0.5 × 0.5 mm, apex acute. Column ca. 1 mm; pollinia subglobose; caudicles short, viscidia involute, hornlike, rostellum triangular, stigma transversely oblong, situated below the rostellum.

Flowering time. June–August.

Habitat. Terrestrial in *Quercus-Abies* forests and on alpine grassy slopes and meadows at elevations of 2400–4620 m.

Distribution. Bhutan, China, India, Nepal, Pakistan.

Notes. This species has often been confused with *H. duthiei*, which we consider to be a synonym of *H. josephi*. Most specimens identified as *H. duthiei* in the past are referable to *H. macrophyllum*.

Herminium yuanum Tang & F.T. Wang, Bull. Fan Mem. Inst. Biol. 7: 129. 1936. Type: CHINA. Sichuan, Li county, 2900 m, 17.09.1932, *Yu T. T.*, 1543 (Holotype: PE! [PE00027291]).

Herminium spiranthiforme (Ames & Schltr.) Tang & F.T. Wang, Acta Phytotax. Sin. 1: 62. 1951.

Peristylus mannii (Rchb. f.) Mukherjee, Notes Roy. Bot. Gard. Edinburgh 21(3): 153. 1953.

Basionym. *Coeloglossum mannii* Rchb.f., Linnaea 41: 54. 1876.

Type. INDIA. Assam, Khasia Hills, 5000 ft; *Mann s.n.* (Holotype: W).

Description. Plant 10–43 cm tall. Tubers oblong, 1–2.5 × 0.5–1 cm. Stem with 2–4 leaves and 2 tubular sheaths at base. Leaves linear, 3–14 × 0.2–0.4 cm, apex acuminate. Inflorescence 10–37 cm; peduncle cylindrical, peduncle-scales 1–5, lanceolate, 2–20 mm; rachis 4–16 cm, laxly many-flowered; floral bracts ovate-lanceolate, 2–4 mm, shorter than ovary, apex acuminate. Flowers pale yellowish green; ca. 3 mm across, pedicel and ovary 2–5 mm. Dorsal sepal ovate, concave, 2–2.5 × 0.8–1 mm, apex obtuse; lateral sepals oblong-lingulate, 2–2.5 × 0.8–1 mm, apex obtuse. Petals hooded with dorsal sepals, obliquely ovate-lanceolate, 2–2.5 × ca. 0.8 mm, apex obtuse. Lip oblong-ovate, 2.5–3 × 0.8–1 mm, base deeply concave, ecallose, 3-lobed near middle; lateral lobes oblong, 0.8–1.5 mm; mid-lobe oblong, slightly attenuate, 1–2 mm, spur pendulous, scrotiform, 1–1.5 mm, apex obtuse. Column 0.3–0.5 mm;

pollinia globose, caudicles short, viscidia ellipsoid, rostellum triangular, shortly armed, stigma transversely oblong-clavate, extended outwards at base of lip.

Flowering time. August–October.

Habitat. Terrestrial in forest margins and on grassy slopes at elevations of 1700–3400 m.

Distribution. China, India, Myanmar, Nepal.

Specimens examined. Basionym. *Ophrys monorchis* L., *Sp. Pl.* 2: 947. 1753.

Type. Without country and precise locality, *Anon*, *s.n.* (Lectotype: LINN! [LINN-HL1056–22]).

Description. Plant 5–38 cm tall. Tubers globose, $5\text{--}10 \times 4\text{--}10$ mm. Stem with 1 or 2 tubular sheaths at base and (1–)2–3 leaves. Leaves subopposite to well-spaced, elliptic or elliptic-lanceolate, $2\text{--}13 \times 0.5\text{--}2.9$ cm, apex acute. Inflorescence 3–38 cm;

peduncle cylindrical, with 0–4 ovate-lanceolate to linear peduncle-scales (sometimes leaf-like), rachis 2–24 cm, densely to subclaxly many flowered; floral bracts linear-lanceolate, 2–7 mm, shorter than or as long as ovary, apex acuminate. Flowers yellowish green; pedicel and ovary twisted, beaked and strongly hooked at apex, 3–7 mm. Dorsal sepal ovate-lanceolate, 2–3 × 1–1.5 mm, apex obtuse; lateral sepal ovate-lanceolate, slightly oblique, 2–2.7 × 0.8–1.1 mm, apex subacute. Petals rhombic-caudate, falcate, fleshy, 2.5–4.7 × 1–1.5 mm, apex acute. Lip oblong, 2–5 × 1.1–1.5 mm, base concave forming an almost spur-like sac, 3-lobed near middle; lateral lobes linear-triangular, 0.9–1.2 × 0.4 mm, apex acute; mid-lobe linear-triangular, 2.2–3 × 0.4–1 mm, apex (sub)acute. Column 0.8 mm; pollinia subglobose; caudicles very short, viscidia large, involute, hornlike, rostellum triangular, stigma transversely oblong, situated below the rostellum. Fruit oblongoid, suberect, c. 9 mm long.

Flowering time. (June–)July–August.

Habitat. Terrestrial in broad-leaved or coniferous forests, extensively grazed meadows on chalk and limestone, swampy grassland, alpine meadows and valleys; in Asia at elevations of 600–4700 m; in Europe (including the Caucasus) 0–2400 m.

Distribution. China, India, Japan, Korea, Mongolia, Nepal, Pakistan, Russia, C and W Asia, most parts of Europe, excluding the Mediterranean zone and the far North.

Selected specimens examined (only a small sample of the numerous European specimens studied are cited below). AUSTRIA: Tirol, Falzthurntal, 1100 m, 10.07.1936, *Milne-Redhead*, *E.* 2380 (K).

36. *Herminium neotineoides* Ames & Schltr., *Repert. Spec. Nov. Regni Veg. Beih.* 4: 42. 1919.

Peristylus neotineoides (Ames & Schltr.) K. Y. Lang, *Acta Phytotax. Sin.* 25: 453. 1987.
Monorchis neotineoides (Ames & Schltr.) O. Schwarz. *Mitt. Thüring. Bot. Ges.* 1: 95. 1949.

Type. CHINA. Sichuan, Western Szechuan, 12000 ft, 1907, *Wilson E. H.*, 1768 (Holotype: AMES! [AMES 00100259]; Isotypes: AMES! [AMES00100261], K! [K000796955]).

Description. Plant 20–38 cm tall. Tubers oblong-ovoid, 1–2 × 1–1.5 cm. Stem with 2–3 tubular sheaths and 2 leaves at base. Leaves subopposite, oblong-lanceolate, 4–15 × 0.8–3 cm, apex acute to acuminate. Inflorescence 25–28 cm, peduncle cylindrical, with 1 peduncle-scale; rachis 8–18 cm, densely many flowered; floral bracts

lanceolate, 5–15 × 1–2 mm, longer than ovary, apex acuminate. Flowers green; pedicel and ovary 4–5 mm. Dorsal sepal elliptic, 2–2.5 × 1–1.5 mm, apex obtuse; lateral sepals spreading, elliptic, 2–2.5 × 1.5 mm, apex obtuse. Petals hooded with dorsal sepal, ovate-lanceolate, oblique, 2–2.5 × ca. 1 mm, concave, apex obtuse. Lip ovate, 2–3 × 2–2.5 mm, base concave, 3-lobed toward apex; disk with a subglobose callus; lateral lobes lanceolate, falcate, apex obtuse; mid-lobe ovate-lanceolate, slightly longer and broader than lateral lobes, apex obtuse; spur saccate; Column ca. 1.5 mm, viscidia ovate, rostellum triangular, 1 mm, stigma transversely oblong.

Flowering time. July.

Habitat. Terrestrial on grassy slopes and pastures between *Pinus* trees at elevations of 3100–4000 m.

Distribution. China (Sichuan).

Specimens examined. CHINA: **Sichuan**, Kangding county, 3150 m, 24.07.1963, Guan K. & Wang W. *et al.* 340 (PE).

37. *Herminium ophioglossoides* Schltr., Notes Roy. Bot. Gard. Edinburgh 5: 96. 1912.
Fig. 9N

Monorchis ophioglossoides (Schltr.) O. Schwarz, Mitt. Thüring. Bot. Ges. 1: 95. 1949.

Type. CHINA. Yunnan, Lijiang, 10000 ft, 07.1906, *Forrest G.*, 2466 (Holotype: E! [E00188160]; Isotypes: K! [K000079034], P! [P00378738]).

Description. Plant 6–26 cm tall. Tubers globose to ovoid, 10–30 × 5–15 mm. Stem with 2–3 tubular sheaths and 1–3 leaves at base. Leaves elliptic-lanceolate, 2–10 × 0.5–3 cm, apex obtuse. Inflorescence 4–20 cm; peduncle cylindrical, ebractiate or rarely single foliaceous sterile bract, 0.5–3 cm; rachis 1–14 cm, laxly many flowered; floral bracts lanceolate, 2–5 mm, shorter than ovary, apex acuminate. Flowers yellowish green; pedicel and ovary arcuate, twisted, beaked at apex, 4–10 mm. Dorsal sepal oblong-lanceolate, 3.5–5 × 1–2 mm, apex obtuse; lateral sepals oblong-lanceolate, 3–5 × 1–2 mm, apex obtuse. Petals narrowly lanceolate-caudate, falcate, 5–7 × 0.6–0.9 mm, apex obtuse. Lip oblong, 5–7 × 1.5–2.5 mm, base deeply concave with 1 mm, globose spur, 3-lobed at or below middle; lateral lobes linear, 2–4 × ca. 0.5 mm at base; mid-lobe linear, 3–5 × ca. 0.4 mm, apex acute. Column ca. 1 mm; pollinia globose; caudicles indistinct or very short, viscidia involute, hornlike, rostellum triangular, with arm-like lobes, stigma transversely oblong, situated below the rostellum. Fruit oblong, 5–11 mm long.

Flowering time. June–July.

Habitat. Terrestrial on grassy slopes at elevations of 2100–3600 m.

Distribution. China (Qinghai, Sichuan, Yunnan).

Basionym. *Androcorys oxysepalus* K.Y. Lang, *Guihaia* 16: 106. 1996.

Type. CHINA. Yunnan, Shangri-La, 3700 m, 10.08.1981, *Hengduan Mountain Team of Institute of Botany*, 2917 (Holotype: PE!).

Description. Plant 6–16 cm tall. Tuber globose, ca. 5 × 5 mm in diam. Stem slender, with 2 tubular sheaths and 1 leaf at base. Leaf elliptic or oblong, 1.5–1.7 × 0.8–0.9 cm, apex obtuse. Inflorescence 5–12 cm, rachis 1.8–4 cm, 6–7-flowered; floral bracts ovate, ca. 0.1 mm, shorter than ovary, apex acute. Flowers green, ovary and pedicel fusiform, slightly beaked, 3–3.3 mm. Dorsal sepal broadly ovate, concave, ca. 1–1.5 × 1–1.6 mm, margin denticulate, apex acute; lateral sepals spreading, oblong-lanceolate, concave, ca. 2.5–3 × 1–1.3 mm, margin denticulate, apex acuminate. Petals oblong-lanceolate, oblique, concave, ca. 1.5–2 × 0.8–1 mm, apex obtuse. Lip deflexed, lingulate-lanceolate, ca. 1.5–2 mm, fleshy, base dilated, apex obtuse. Column ca. 0.5 mm, anther with 2 divergent, hooded locules and broad connective; pollinia 2, clavate, attached to a viscidium by short caudicle; rostellum triangular; stigma 2 pulvinate, attached to base of rostellum. Fruit fusiform, 5–7 mm long.

Flowering time. August.

Habitat. Terrestrial in *Abies* forest at an elevation of 3700 m.

Distribution. China (Yunnan).

Specimens examined. CHINA: **Yunnan**, Zhongdian, 3700 m, 10.08.1981, *Hengduan Mountain Team of Institute of Botany*, 2917 (PE); **Tibet**, Yadong county, 25.08.2013, *FLPH Tibet Expedition Team*, 13–2182 (PE).

39. *Herminium pugioniforme* Lindl. ex Hook.f., Fl. Brit. India 6: 130. 1890.

Fig. 5I

Androcorys pugioniformis (Lindl. ex Hook.f.) K. Y. Lang, *Guihaia* 16: 105. 1996.

Type. INDIA. **Uttarakhand**, Garhwal, Dudu Glacier under Srikanta, 14000–15000 ft, 10.08.21883, *Duthie J. F.*, 517 (Syntype: K! [K000387533]); **Sikkim**, Samdong, 16000 ft, 11.09.1849, *Hooker J. D.*, s.n. (Syntype: K! [K000387531], K-LINDL!); **Kashmir**, Kilan Marg, 12000 ft, 08.1877, *Aitchison*, 106 (Syntype: K! [K000387532]).

Description. Plant 5–20 cm tall. Tuber globose, 5–8 × 4–8 mm. Stem with 1 or 2 tubular sheaths and 1 leaf at base. Leaf oblanceolate, 2–4 × 0.4–1.2 cm, apex obtuse. Inflorescence 3–10 cm, rachis 1–4 cm, 3–20-flowered; floral bracts ovate, much reduced, shorter than ovary, apex acute. Flowers green; ovary and pedicel 4–5 mm, fusiform, apex beaked, 3–5 mm. Dorsal sepal broadly elliptic-orbicular, concave, 1.5–2.5 × 1–1.2 mm, apex obtuse; lateral sepals obovate to elliptic, oblique 1.7–2.2 × 1–1.2 mm, apex obtuse. Petals obovate, oblique, concave, 1.3–1.5 × 0.5–0.8 mm, apex obtuse. Lip narrowly lingulate-oblong, 1.5–2.0 mm long, base rather abruptly dilated, 0.6–1.1 mm wide, with two basal concavities separated by a longitudinal callus ridge, apex obtuse. Column 0.5–1 mm, anther with 2 divergent locules hooded with ca. 0.6 mm broad connective; pollinia 2, clavate, attached to ellipsoid viscidium by short caudicle; rostellum triangular; stigma gibbous, attached to base of rostellum. Fruit fusiform, 3–4 mm long.

Flowering time. July–September.

Habitat. Terrestrial in *Abies* forests, alpine grasslands, meadows and valleys at elevations of 2700–5200(–5500) m.

Distribution. Bhutan, China, India, Nepal.

Note. Pridgeon et al. (2001: 257) stated that this species may occur up to 5500 m, but we have not seen specimens collected above 5200 m.

Specimens examined. Androcorys japonensis Maek., J. Jap. Bot. 12: 96. 1936. Type: JAPAN. Hondo, Shinano Prov., Mt. Yuo, 18.08.1902, *Yabe Y. s.n.* (Holotype: Herb. Univ. Imp. Tokyo).

Type. CHINA. Taiwan. Taichu (Mt. Niitakayama), 07.1933, *Ohwi J.*, (TAI!).

Description. Plant 10–22 cm tall. Tuber globose, 5–7 mm in diam. Stem slender, with 1–3 tubular sheaths and 1 leaf at base. Leaf ovate, 2–4.5 × 1–2.2 cm, apex obtuse. Inflorescence 5–10 cm, rachis ca. 2.5 cm, 8–13-flowered; floral bracts ovate, ca. 1.5 mm, shorter than ovary. Flowers green; ovary and pedicel, fusiform, slightly beaked, 3–4 mm. Dorsal sepal erect, broadly ovate, concave, 1–1.2 × ca. 1 mm, margin irregularly ciliated, apex obtuse; lateral sepals spreading, oblong, 2–3 × 0.7–1 mm, margin ciliated, apex obtuse. Petals oblong, concave, 1.2–1.5 × ca. 1 mm, base cuneate, apex obtuse. Lip lingulate, 2–2.2 × ca. 0.7 mm, fleshy, base dilated, apex obtuse. Column short, anther with 2 divergent, hooded locules and broad connective; pollinia 2, clavate, attached to a viscidium by short caudicle; rostellum triangular; stigmalobes 2, pulvinate, attached to base of rostellum.

Flowering time. July.

Habitat. Terrestrial in forest margins and alpine valleys at elevations of 2500–3500 m.

Distribution. China, Korea, Japan.

Specimens examined. CHINA: TAIWAN, Hualien county, Nanhuchih shelter, 3100–3400 m, 07.07.2005, *Chuan T.*, 215 (TAIF).

Type. BHUTAN. Thimphu district, below Darkey Pang Tso, north of Paro, 3960 m, 04.08.1991, *Noltie H. J.*, 105 (Holotype: E! [E00008013]).

Description. Plant 2–16 cm tall. Tuber globose, 3–4 × 3–4 mm. Stem with a sheath and 2–3 basal leaves. Leaves linear-oblong, 1.5–3.5 × 0.5–0.15 cm, apex subacute. Inflorescence 2–10 cm, peduncle cylindrical with 1.5–2.5 × 0.5–2 mm, lanceolate, acute peduncle-scales, rachis glabrous, 2–4.5 mm long subdensely 3–5-flowered; floral bracts minute, lanceolate, acute, 0.5–2 × 0.5–0.6 mm. Flowers secund, 3–5 mm long, sepals green, petals yellowish, pedicel and ovary swollen, 3–5 × 1–1.3 mm, apex beaked and strongly hooked. Dorsal sepal ovate, concave, 3–4 × 1.5 mm, apex obtuse, lateral sepals ovate-lanceolate, oblique, apex obtuse, 3–4 × 1.5–2 mm. Petals trowel-shaped, oblique, fleshy and narrowed towards apex, apex subacute, 3–3.5 × 1–1.5 mm, lip ovate, base concave, spurless, 3–4 × 2–2.5 mm, 3-lobed above middle, lateral lobes triangular, obtuse; mid-lobe narrowly triangular, apex acute, 1 mm long. Column 0.7 mm tall, pollinia globose; caudicles indistinct, viscidia involute, horn-like, rostellum triangular, stigma transversely oblong, situated below the rostellum. Fruit oblong, 4–5 mm long.

Flowering time. July–August.

Habitat. Terrestrial on wet cliff ledge at elevations of 3900–4000 m.

Distribution. Bhutan, China.

Specimens examined. CHINA: **Tibet**, Yadong county, Xiakangbu to Shang Kangbu, Road 714, 71 km, 3965 m, 24.08. 2013, *FLPH Expedition Team*, 13-2115 (PE).

Figs 5H, 6O, 7O, 8O, 9O

Monorchis quinqueloba (King & Pantl.) O. Schwarz, Mitt. Thüring. Bot. Ges. 1: 96.1949.

Type. INDIA. Sikkim, Tendong, 7000 ft, 08.1894, *Pantling R.*, 339 (Holotype CAL; Isotype: K! [K000079023]).

Description. Plant 15–30 cm tall. Tubers oblong to subglobose, 15–20 × 5–15 mm. Stem with 2 tubular sheaths at base and 2–3 leaves. Leaves subopposite, linear-lanceolate, 10–17 × 1–2 cm, apex acute. Inflorescence 10–20 cm; peduncle with a foliaceous linear-lanceolate peduncle-scale; rachis 10–15 cm, many flowered; floral bracts lanceolate, 3–8 mm, equal or longer than ovary, apex acuminate. Flowers greenish white; pedicel and ovary straight, apex beaked, 5–10 mm. Dorsal sepal oblong-lanceolate, 2–3.5 × 0.5–1 mm, apex obtuse; lateral sepals oblong, 2–3 × 0.6–1 mm, apex subacute. Petals linear, 1.6–3.5 × ca. 0.3–0.5 mm, apex acute. Lip oblong, 5-lobed, 2–3.5 × 0.7–1 mm, base dilated and concave; basal lobes triangular, lateral lobes linear, 1 × 0.5 mm, apex acute; mid-lobe oblong-triangular, 1.5 × 0.5 mm, apex acuminate. Column ca. 7 mm, stigma transversely oblong, situated underneath the rostellum; auricles oblong, rostellum triangular; pollinia obovoid; caudicles short, viscidia disklike. Fruit oblong, 1 cm long.

Flowering time. August–September.

Habitat. Terrestrial on moist slopes or epiphytic in evergreen broad-leaved forests at elevations of 2100–3000 m.

Distribution. Bhutan, China, India, Nepal.

Specimen examined. CHINA: **Yunnan**, Gongshan county, 2200 m, 03.09.1982, *Qinghai-Tibet Team*, 9908 (PE).

INDIA: **Sikkim**, Tendong, 2134 m, 08.1894, *Pantling R.*, 339 (K).

43. *Herminium singulum* Tang & F. T. Wang, Bull. Fan Mem. Inst. Biol. Bot. 10: 35. 1940.

Type. CHINA. Yunnan, Salween-Chiukiang, east of Wang-tzang, 2800 m, *Yu T.T.*, 20231A (Holotype: PE! [PE01432256]).

Description. Plant 10–30 cm tall. Tubers subglobose, 8–10 mm. Stem with one or two tubular sheaths and 1 leaf at base. Leaf elliptic, 2–5 × 1–2 cm, apex obtuse. Inflorescence 6–25 cm; peduncle cylindrical, with 1 or 2 lanceolate peduncle-scales, 1–1.5 cm; rachis 2–10 cm, subclaxly 4 or many flowered; floral bracts lanceolate, 5 × 2 mm, shorter or longer than to ovary, apex acuminate. Flowers pedicel and ovary arcuate, apex beaked, 6–10 mm. Dorsal sepal ovate-lanceolate, 2–3 × 1–1.3 mm, concave, apex acute; lateral sepals reflexed, obliquely ovate, 2.5–3 × 0.8–1 mm, apex acute. Petals ovate, oblique, ca. 1.8–2.2 × 1–1.5 mm, apex obtuse. Lip lanceolate, 3.2–5 × 1–1.3 mm, entire, base dilated and spurred, apex obtuse; spur cylindrical shorter than ovary. Column 1.5 mm; caudicles short, rostellum triangular, stigma transversely oblong, situated below rostellum.

Flowering time. August–September.

Habitat. Terrestrial in forest margins at elevations of 2600–2800 m.

Distribution. China (Sichuan, Yunnan).

Specimens examined. CHINA: **Yunnan**, Gongshan county, Dulong, Gaolingshan, 1979, *Liu L.H., et al.* 08–14 (PE); Salween-Chiukiang, 2800 m, 03.09.1938, *Yu T. T.*, 20231A (PE).

Monorchis limprichtii (Schltr.) O. Schwarz, Mitt. Thüring. Bot. Ges. 1: 95. 1949.

M. souliei (Finet) O. Schwarz, Mitt. Thüring. Bot. Ges. 1: 95. 1949.

Basionym. *Herminium angustifolium* var. *souliei* Finet, Rev. Gén. Bot. 13: 518. 1901.

Type. CHINA. Tibet, Kiala Dist., Togolo, 18.08.1893, *Soulié J. A.*, 407 (Holotype: P! [P00378650]; Isotypes: K! [K000079033], P! [P00378650]).

Description. Plant 8–38 cm tall. Tubers oblong-ellipsoid, 8–25 × 5–15 mm. Stem with 2 or 3 tubular sheaths at base and 2–4 leaves. Leaves well-spaced, linear to lanceolate, 4–20 × 0.5–1.5 cm, apex acute. Inflorescence 5–25 cm; peduncle cylindrical,

with peduncle-scales 0.5–2.5 cm; rachis 2.5–20 cm, densely many flowered; floral bracts ovate-lanceolate, 2–5 mm, equal, shorter or longer than ovary, apex acuminate. Flowers pale green; pedicel and ovary arcuate, 5–10 mm, shortly beaked. Dorsal sepal ovate, concave, $2-3 \times 1.5-2$ mm, apex obtuse; lateral sepals ovate, oblique, $2.9-3.5 \times 1.2-2.5$ mm, apex obtuse. Petals connivent with dorsal sepal forming a hood, linear, $2-3 \times 0.4-0.6$ mm, apex obtuse. Lip oblong, $2.6-4.5 \times 0.7-1.2$ mm, 3-lobed; lateral lobes linear-falcate, 0.5×0.3 mm; mid-lobe oblong, 0.6×0.3 mm, apex obtuse. Column 1 mm; pollinia ovoid; caudicles short, viscidia ovoid, rostellum triangular, stigma transversely oblong, situated below the rostellum. Capsule oblong, 1 cm.

Flowering time. July–August.

Habitat. Terrestrial in broad-leaved forests margins or on grassy slopes at elevations of 1400–4200 m.

Distribution. China, Nepal.

Note. Morphologically, *Herminium souliei* is similar to *Herminium lanceum*, but *H. souliei* is shorter in stature and the lip is flatter, which gives the flowers a more spidery appearance.

Specimens examined. CHINA: **Sichuan**, Muli county, 2800 m, 03.08.1937, *Yu C. Type. CHINA. Yunnan, 20.08.1906, *Ducloux F.*, 3971 (Holotype P! [P00378693]).

Description. Plant 20–30 cm tall. Tubers subglobose to oblong-ellipsoid, 10–20 mm. Stem with 3–4 tubular sheaths at base and 2–3 subbasal leaves. Leaves orbicular or elliptic, $2.1\text{--}5 \times 2\text{--}2.6$ cm, apex subacute to acuminate. Peduncle cylindrical, with several triangular lanceolate peduncle-scales, rachis 4–10 cm, subdensely many-flowered; floral bracts lanceolate, 6–7 mm, slightly shorter than ovary, apex acuminate. Flowers white; pedicel and ovary twisted, beaked, ca. 8 mm. Dorsal sepal ovate, ca. 2.5×1.6 mm, apex obtuse; lateral sepals oblanceolate, ca. 2.6×1 mm, apex obtuse. Petals ovate, oblique, $1.2\text{--}2.4 \times ca. 1.2$ mm, apex obtuse. Lip decurved, ovate-pandurate, ca. 2.5×1.4 mm, somewhat fleshy, base dilated and shallowly concave, contracted near middle, margin entire, apex dilated and obtuse. Column short; viscidia elliptic, ca. 0.8 mm.

Flowering time. August.

Distribution. China (Yunnan).

Note. Our description is based on Chen et al. (2009).

47. *Herminium tibeticum* X.H. Jin, Schuit. & Raskoti, sp. nov.

urn:lsid:ipni.org:names:77161963-1

Fig. 15

Type. CHINA. Tibet, Medog, 52 km region of the road from Bomi to Motuo, 3600–3700 m, 28.08.2012, *Jin X.H., Jin W.T. and Xu S.Z.*, 13185 (PE).

Figure 15. *Herminium tibeticum*. **A** Flowering plant **B** Flower (side view) **C** Flower spread (front view) **D** Dorsal sepal, lateral sepal and petal **E** Lip **F** Section of ovary with column **G** Floral bract **H** Column with stigma (front view) **I** Anther cap, auricles and viscidium.

Diagnosis. *Herminium tibeticum* is similar to *Herminium pygmaeum* and *H. josephi*, but differs from the former in having strongly falcate petals and a lip with a callus; from the latter in having a 3-lobed and cuneate lip.

Description. Plant 13–16 cm tall. Tubers subglobose, 4–8 × 4–6 mm, with slender roots. Stem with tubular sheaths at base, and often 1 or rarely 2-leaved. Leaves cauline, lanceolate, 4.0–5.0 × 0.8–1.0 cm, apex acute, base sheathing. Peduncle 7–8 cm, slender, without peduncle-scales; rachis 2.5–5.5 cm, with five to several subsecund flowers; floral bracts ovate, 1–2 × 0.5–1.0 mm, about equal to the pedicel, apex acute. Flowers drooping, greenish, 4–5 mm across, ovary fusiform, shortly pedicellate, slightly arcuate, 4–7 mm long, ridged, apex strongly beaked. Dorsal sepal ovate, 3.0 × 1.9 mm, 1-veined, apex sub-obtuse; lateral sepals spreading, ovate, oblique, 3.0 × 1.3 mm, apex obtuse. Petals lanceolate, falcate, 3.0–5.0 × 1.0–1.5 mm, 1-veined, middle portion crenulate, apex acute. Lip cuneate, apiculate, 5.5–6.0 × 1.5–2.5 mm, base saccate, concave, with two longitudinal 1.9 mm long calli, 3-nerved, shallowly 3-lobed; lateral lobes triangular, smaller than the midlobe, 1.0 × 0.4 mm, crenulate, apex obtuse; midlobe narrowly triangular, 1.2 × 1.0 mm, apex sub-obtuse. Column ca. 1.4 mm long; stigma transverse, ca. 2.8 mm long, rostellum 0.5 mm, three lobed, mid-lobe larger than the lateral lobes; auricle ca. 0.6 mm long; pollinia 1.2 mm, globose; viscidia globose.

Flowering time. July.

Distribution. Endemic to China.

Habitat. Terrestrial in grassland on open slopes in evergreen forest at elevations of 3600–3700 m.

Etymology. Named for Tibet, origin of type.

Notes. *Herminium tibeticum* is most similar to *Herminium pygmaeum* Renz in petal and lip shape; it differs from the latter in having strongly falcate petals, and a lip with two parallel longitudinal calli at the base.

48. *Herminium wangianum* X.H. Jin, Schuit., Raskoti & L.Q. Huang, *Cladistics* 2015.

Not *Herminium spirale* (A. Rich.) Rchb. f., Bonplandia (Hannover) 3: 213. 1855 (= *Benthamia africana* (Lindl.) Hermans).

Replaced name. *Androcorys spiralis* Tang & F. T. Wang, Bull. Fan Mem. Inst. Biol. Bot. 10: 38. 1940.

Type. CHINA. Tibet, Chayu, 3500 m, 09.1935, Wang C.W., 66285 (PE!).

Description. Plant 5–12 cm tall. Tuber globose, 5–8 mm in diam. Stem slender, with 2 tubular sheaths and 1 leaf at base. Leaf oblong, 2–2.5 × 0.8–1 cm, apex obtuse. Inflorescence 4–5 cm, ebracteate, rachis 2–2.5 cm, 3–8-flowered; floral bracts spirally twisted, linear, shorter than ovary, apex acuminate. Flowers green; ovary and pedicel,

fusiform, apex shortly beaked, 3–7 mm. Dorsal sepal broadly ovate-elliptic, concave, $1.5\text{--}2 \times 1.3\text{--}1.8$ mm, apex apiculate; lateral sepals spreading, oblong-lanceolate, $2\text{--}2.5 \times 1\text{--}1.2$ mm, apex obtuse. Petals oblong, oblique, $1.3\text{--}2 \times 0.5\text{--}0.7$ mm, apex obtuse. Lip linear-lingulate, 1.8–2.1 mm, fleshy, base dilated and ca. 0.8 mm wide, apex obtuse. Column short, anther with 2 divergent, hooded locules and broad connective; pollinia 2, clavate, attached to a viscidium by short caudicle; rostellum triangular; stigma 2 pulvinate, attached to base of rostellum.

Flowering time. September.

Habitat. Forested slopes at elevations of 2800–4800 m.

Distribution. China (Sichuan, Xizang, Yunnan).

Specimen examined. CHINA: **Qinghai**, Zadoi county, 4800 m, 25.07.1965, *Liu S. W.*, 217 (PE); **Sichuan**, Muli county, 2800 m, 15.08.1937, *Yu T. T.*, 7736 (PE); **Tibet**, Zayu county, 3500 m, 09.1935, *Wang C. W.*, 66285 (PE); Zayu county, 2800 m, 08.1938, *Wang Q. W.*, 65222 (PE); Zayu county, Chawalong, 3200 m, 08.1935, *Wang C. W.*, 65782 (PE); Nyalam county, 4600 m, 20.08.2010, *PE-Tibet Team*, 01640 (PE).

49. *Herminium yunnanense* Rolfe, Notes Roy. Bot. Gard. Edinburgh 8: 24. 1913.

Monorchis yunnanensis (Rolfe) O. Schwarz, Mitt. Thüring. Bot. Ges. 1: 96. 1949.

Type. CHINA. Yunnan, Tsan-Shan Range, near Yang Bi Pass, *Forrest G.*, 907 (Holotype: E! [E00188161]).

Description. Plant 15–27 cm tall. Tubers ovoid-oblong, $5\text{--}20 \times 4\text{--}8$ mm. Stem with 2 tubular sheaths and 1 leaf at base. Leaf linear-oblong, $8\text{--}14 \times 0.5\text{--}1$ cm, apex acute. Inflorescence 14–22 cm; peduncle cylindrical, with few lanceolate pedunclescales; rachis 5–9 cm, densely many-flowered; floral bracts ovate, 3–5 mm, shorter than ovary, apex acuminate. Flowers yellowish green; pedicel and ovary, twisted, beaked at apex, 3–6 mm. Dorsal sepal broadly ovate, concave, $1.5\text{--}2 \times 1\text{--}1.6$ mm, apex obtuse; lateral sepals ovate, slightly oblique, $1.5\text{--}2.3 \times 1\text{--}1.5$ mm, apex obtuse. Petals hooded with dorsal sepal, concave, ovate, $1\text{--}1.5 \times 1\text{--}1.3$ mm, apex subacute. Lip oblong, $2\text{--}2.5 \times 1\text{--}2$ mm, concave, apex 3-lobed; lateral lobes triangular, 0.5×0.3 mm, apex acute; mid-lobe triangular, 0.7×0.7 mm, apex obtuse. Column ca. 1 mm; pollinia globose; caudicles short, viscidia ovoid; rostellum clavate, stigma transversely oblong, situated below the rostellum. Fruit oblong, 5–7 mm long.

Flowering time. August–September.

Habitat. Terrestrial on grassy slopes at elevations of 2200–3300 m.

Distribution. China (Yunnan).

Specimens examined. CHINA: **Yunnan**, Fugong county, 19.07.2013, *Jin X. H.*, *Wang L. S.*, *Wang Q. et al.* ST0599 (PE); Chuxiong city, 2200 m, 23.09.1939, *Li M. K.*, 0170 (PE); Yangbi county, 2673 m, 24.07.2006, *Jin X. H.*, 8273 (PE).

Excluded species

***Herminium gongganum* Ormerod, *Taiwania* 58: 27 (2013).**

Note. Judging from the protologue, an image of the holotype, and our own field observations of similar plants (which had fleshy rootstocks, lacking a tuber), this taxon belongs to the genus *Platanthera*. Efimov (2016) transferred this species to *Platanthera*.

***Herminium orbiculare* Hook.f., *Fl. Brit. India* 6: 129 (1890).**

Note. Based on an examination of living and type material as well as a phylogenetic analysis using DNA data (Jin et al., unpublished) it is apparent that this species belongs in *Platanthera*, necessitating the following new combination.

***Platanthera orbicularis* (Hook.f.) X.H. Jin, Schuit. & Raskoti, comb. nov.**

urn:lsid:ipni.org:names:77161964-1

Basionym. *Herminium orbiculare* Hook.f., *Fl. Brit. India* 6: 129 (1890).

Type. CHINA. Xizang, Chumbi Valley, Rungboo (Kungphu), *King's Collector s.n.* (Holotype: K! [K000079022]).

Acknowledgements

Special thanks are due to Vincent Droissart and Tariq Stévant for the critical reading and editing of the manuscript. We are sincerely grateful to curators and technical staff of the herbaria listed for their invaluable assistance. We are grateful to Zhu Yunxi for preparing the line drawings. Funds were provided by grants from the National Natural Science Foundation of China (Grant No. 31670194, 31470299, J1310002, 31110103911), and Southeast Asia Biodiversity Research Institute, Chinese Academy of Sciences (Grant No. Y4ZK111B01).
